Shipment of the Print/Fax server

If for any reason you must ship your print server, carefully package the print server to avoid any damage during transit. It is recommended that you save and use the original packaging. The print server should also be adequately insured with the carrier.

WARNING

When shipping the Print/Fax server, put it into the anti-static bag to avoid damage.
Introduction

Overview

The Imagistics NC-9100h Print / Fax Server allows your Imagistics machine to be attached and shared on a 10/100Mbit Ethernet Network. Web Based Management and Administration utilities provide easy configuration and management of your Imagistics machine. Once installed and configured, the Print/Fax Server allows your machine to FAX documents over the Internet; print and scan documents over a network. The Print/Fax Server is even supplied with Imagistics Peer to Peer printing software allowing you to easily share the machine as a small department printer.

Features

Internet Fax (For ix2700 only)

The Imagistics machine can be assigned an E-mail address allowing you to send, receive and forward documents on a Local Area Network and the Internet to PC's or other Internet Fax machines.

SMTP/POP3 mail server support.

Network Printing

The Print / Fax server can be utilized as a print server providing printing services for the Windows® 95/98/Me, Windows® NT®4.0/2000/XP, Unix Systems supporting the TCP/IP protocols, Novell Operating Systems supporting IPX/SPX and Macintosh Networks supporting AppleTalk or Rendezvous.

Network Scanning

You can scan documents into a PC on your Network directly or the Imagistics machine can E-mail them to your PC for editing in Black & White or Color.

Management Utilities

The Web Based Management and BRAdmin Professional utilities provide powerful easy to use management of Fax, network and E-mail settings.
Federal Communications Commission (FCC) Declaration of Conformity (For U.S.A. only)

Responsible Party: Imagistics International, Inc.
100 Oakview Drive Trumbull, CT 06611, U.S.A.
TEL: (800) 290-7860

declares, that the products
Product Name: Network Card (BR-net)
Model Number: NC-9100h

complies with Part 15 of the FCC Rules. Operation is subject to the following two conditions: (1) This device may not cause harmful interference, and (2) this device must accept any interference received, including interference that may cause undesired operation.

This equipment has been tested and found to comply with the limits for a Class B digital device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in a particular installation. If this equipment does cause harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one or more of the following measures:

- Reorient or relocate the receiving antenna.
- Increase the separation between the equipment and receiver.
- Connect the equipment into an outlet on a circuit different from that to which the receiver is connected.
- Consult the dealer or an experienced radio/TV technician for help.

Important
Changes or modifications not expressly approved by Imagistics International, Inc. could void the user's authority to operate the equipment.

Industry Canada Compliance Statement (For Canada only)

This Class B digital apparatus complies with Canadian ICES-003.
Cet appareil numérique de la classe B est conforme a la norme NMB-003 du Canada.
Declaration of Conformity (Europe)
We, Imagistics International Ltd
Field House, Station Approach, Harlow, Essex, CM20 2WE, UK
declare that this product is in conformity with the following normative documents.
Safety: EN 60950,
EMC: EN 55022 Class B, EN 55024

following the provisions of the Low Voltage Directive 73/23/EEC and the
Electromagnetic Compatibility Directive 89/336/EEC (as amended by 91/

Issued by: Imagistics International, Inc.

Caution for LAN connection
Connect this product to a LAN connection that is not subjected to overvoltages.

Printing from Unix/Linux using TCP/IP

Overview

Imagistics Print/Fax servers are supplied with the Transmission Control Protocol/Internet Protocol (TCP/IP) protocol suite. Since virtually all UNIX host computers support TCP/IP, this capability allows a printer to be shared on a UNIX Ethernet network. As with all protocols, TCP/IP communications can proceed concurrently while other protocols are active, this means that UNIX, NetWare, Apple, and other computers can share the same Imagistics print server over an Ethernet network.

The Linux operating system uses the same setup procedures as standard Berkeley UNIX systems. Refer to this chapter for a typical GUI based Linux installation.

Quick Tips:

1. The Automatic Private IP Addressing (APIPA) protocol automatically assigns an IP address from the range: 169.254.1.0 to 169.254.254.255. If you want to disable the APIPA protocol, set APIPA to Off using control panel of the machine. For more information see page 10-9. If the APIPA protocol is disabled, the default IP address of a Imagistics Print/Fax server is 192.0.0.192. To change it, use the control panel, the BRAdmin Professional utility or let your DHCP server allocate an IP address to the machine.

2. Refer to chapter 11 of this user guide to learn how to configure the IP address on your machine.

3. The default password for Imagistics Print/Fax servers is access.
4 The default name for a Imagistics Print/Fax server is usually BRN_xxxxxx (where xxxxxx is the last six digits of the Ethernet address of the Print/Fax server).

5 When configuring the PRINTCAP file, pay particular attention to the service names, BINARY_P1 and TEXT_P1.

TCP/IP

Imagistics Print/Fax servers appear to the network as a UNIX host computer with a unique IP address running the lpd (line printer daemon) protocol. As a result, any host computer that supports the Berkeley remote LPR command can spool jobs to Imagistics print servers without the need for any special software on the host computer. For special applications, raw TCP ports are also available.

Imagistics Print/Fax servers also support the FTP protocol. This protocol can be used to send print jobs from Unix systems.

The Imagistics Print/Fax server is pre-configured to run on a TCP/IP network with a minimum of setup. The only mandatory configuration of the Print/Fax server is the allocation of an IP address, which can be either automatically assigned using DHCP, BOOTP etc., or manually assigned using the ARP command, BRAdmin Professional utility, or the control panel of the machine.

For setting the IP address of the Print/Fax server, refer to the Quick Setup Guide or to chapter 11 of this user guide.

General TCP/IP UNIX Host Configuration

The configuration process for most UNIX systems is described in the following steps. As this process varies, we recommend that you refer to your system documentation for additional information.

1 Configure the /etc/hosts file on each UNIX host that needs to communicate with the Print/Fax server. Use your favorite editor to add an entry to the /etc/hosts file containing the IP address and node name of the device. For example:

192.189.207.3 BRN_310107
The actual format of the entry may vary depending on your system, check your system documentation and also note the format of other entries in the `/etc/hosts` file.

The node name in this file does not necessarily need to be the same as the one that is actually configured into the Imagistics Print/Fax server (the name that appears on the network configuration page), however, it is good practice to make the names the same. Some operating systems, such as HP/UX, do not accept the “_” character in the default name, for these systems you must use a different name).

In any case, the node name in the `/etc/hosts` file must match the node name in the `/etc/printcap` file.

Some systems such as HP/UX and AIX allow you to enter the IP address as the host name when setting up the print queue. If this is the case, you do not need to configure the hosts file.

2 Choose which Print/Fax server service you want to use. There are several types of services available on Imagistics Print/Fax servers. Binary services pass data through unmodified and are therefore required for PCL or PostScript rasterized graphics printouts. Text services add a carriage return at the end of each line for proper formatting of UNIX text files (which end in linefeed and do not have carriage returns). The text service can also be used for non-rasterized graphics, such as ASCII PostScript graphics or many types of PCL graphics.

Choose one of the available services (a service name will be used in step 3):

BINARY_P1 Binary data
TEXT_P1 Text data (CR added)

You may set up multiple print queues on your UNIX host computer for the same Print/Fax server, each one with a different service name (for example, one queue for binary graphics jobs and one for text jobs).
Configure the `/etc/printcap` file on each host computer to specify the local print queue, the Print/Fax server name (also called remote machine or rm), and the Print/Fax server service name (also called remote printer, remote queue, or rp), and the spool directory.

This step applies to the majority of UNIX systems, including Linux, Sun OS (but not Solaris 2.xx), Silicon Graphics (lpr/lpd option required), DEC ULTRIX, DEC OSF/1, and Digital UNIX. SCO UNIX users should follow these steps, but should also refer to the *SCO UNIX Configuration* section. Users of RS/6000 AIX, HP/UX, Sun Solaris 2.xx, and other systems that do not use the printcap file should skip to section 3-a. SCO user's should also skip to section 3a (SCO uses the printcap file, but this file is automatically configured via the `rlpconf` command).

An example of a typical printcap file:

```
laser1|Printer on Floor 1:\
:lp=:\
:rm=BRN_310107:\
:rp=TEXT_P1:\
:sd=/usr/spool/lpd/laser1:
```

Make sure this information is added to the end of the printcap file. Also make sure that the last character in the printcap file is a colon “:”.

This will create a queue named laser1 on the host computer that communicates to a Imagistics print server with a node name (rm) of BRN_310107 and a service name (rp) of TEXT_P1 printing text files to a Imagistics printer through spool directory /usr/spool/lpd/laser1. If you are printing binary graphics files, you would use the service BINARY_P1 instead of TEXT_P1.
The rm and rp options are not available on some UNIX systems, so if necessary check your documentation to determine the equivalent options.

Users of Berkeley-compatible UNIX systems can use the lpc command to obtain the printer status:

```
lpc status
laser1:
  queuing is enabled
  printing is enabled
  no entries
  no daemon present
```

Users of AT&T-compatible UNIX systems can generally use the lpstat or rlpstat commands to obtain similar status information. Because this procedure varies from system to system, refer to your system documentation for the exact usage.

4 Skip this section if you have completed Step 3, unless you have an SCO UNIX system.

If you have an HP/UX system, IBM RS/6000 AIX computer, or Sun Solaris 2.xx, there is no printcap file. This is also true for some other AT&T-based UNIX systems, as well as many VMS-based TCP/IP software packages (for example, UCX, TGV Multinet, etc.). On SCO systems, there is a printcap file, but it is automatically configured by the rlpconf command. Most of these systems generally use a printer setup program to define the service name (remote printer), the print server name (remote machine) or IP address, and the local queue name (spool directory). Refer to the appropriate section depending on your version of Unix.
Linux Configuration

If you do not wish to use the command line interface to configure your Linux distribution, you may wish to use the Linux Printer System Manager application on your GUI. To do this, do the following:

1. From the Linux Printer System Manager screen, click the **Add** button.

2. You will now be asked to specify which Printer type you are using, select the **Remote Unix (lpd) Queue** option and click **OK**.

3. You must now specify the remote host name, remote queue name and the input filter to use.

4. The **Remote Host** name is the IP address of the printer, or the name from the hosts file which corresponds to the IP address of the printer.

5. The **Remote Queue** name is the service name that the printer will use when processing the data. Generally we recommend that you use the name “BINARY_P1”, however, if you are planning to send text documents that do not have a carriage return and a line feed, then use “TEXT_P1”.

6. Select the appropriate **Input Filter** from the list of available printers on your particular build of Linux.

In order to make your settings work, select the **Restart lpd** option. As soon as the lpd server restarts, you will be able to send printed documents from your server.

**Linux Configuration using CUPS**

Many Linux systems support Common Unix Printing System (CUPS). CUPS typically uses PPD that are on Imagistics BR-Script (Postscript language emulation) ready machines. If you are using a Imagistics printer that does not include the BR-Script emulation you must use an alternative driver.
In the case of HP/UX10.xx, the sam program is used to set up the remote printer. The steps are as follows:

1. Execute the sam program. From the list of options, select **Printers and Plotters**.
2. Select **LP Spooler**.
3. Select **Printers and Plotters**.
4. Select **Actions** and then **Add Remote Printer/Plotter**.
5. Enter any name as the **Printer Name** (this will be the name of the print queue).
6. Enter the IP address of the Print/Fax server as the **Remote System Name**.
7. Enter the desired Print/Fax server service name as the **Remote Printer Name**.
8. Check the box next to **Remote Printer is on BSD system**.
9. You may accept the default values for the remaining items.
10. Click **OK** to configure the printer.

You should now be able to print using the `lp-d` command with the printer name.

If you are using the HP distributed print service, the configuration procedure is slightly different because you are sending the print jobs to a file server, which in turn spools the job to the Print/Fax server. You must therefore know the name of the file server (spooler host) in addition to the above information. You will add a physical and a remote printer, and then assign a logical printer to the remote printer (a unique name that does not match any other name). To print, use the `lp -d` command with the logical printer name.
Earlier versions of HP/UX use similar procedures to 10.xx users:

1. Enter `sam` and select **Peripheral Devices** and then **Add Remote Printer (not Networked printer)**.

2. Enter the following remote printer settings (the other settings do not matter):
   - **Line printer name** (user-selectable).
   - **Remote system name** (the Print/Fax server name; must match what is in hosts file or use Print/Fax server IP address).
   - **Remote printer queue** (Print server binary or text service name, e.g. BINARY_P1 or TEXT_P1).
   - **Remote Printer is on a BSD System** (Yes).

**IBM RS/6000 AIX Configuration**

The RS/6000 AIX operating system uses the smit program to set up the remote printer. The procedure is as follows for AIX 4.0 and later:

1. Enter `smit` and select **devices**.

2. Select **Printer/Plotter**.

3. Select **Print Spooling**.

4. Select **Add a Print Queue**.

5. Select **Remote**.

6. Enter the following Remote Printer Settings:

   - **Name of queue** (user selectable)
   - **Host name of Remote Printer** (Print/Fax server name; must match name in `/etc/hosts` file or use the print server IP address)
   - **Name of queue on remote printer** (Print/Fax server binary or text service name, e.g. BINARY_P1 or TEXT_P1).
   - **Type of print spooler**. BSD (press the LIST button and choose BSD)
The procedure for pre-V4.0 systems is as follows.

1. Enter smit and select devices.
2. Select printer/plotter.
3. Select manage remote printer subsystem.
4. Select client services.
5. Select remote printer queues.
6. Select add a remote queue.
7. Enter the following remote queue settings:
   - **Name of queue to add** (user selectable).
   - **Activate the queue** (Yes).
   - **Destination host** (Print/Fax server name; must match name in /etc/hosts file or use the Print/Fax server IP address)
   - **Name of queue on remote printer** (Print/Fax server binary or text service name, eg. BINARY_P1 or TEXT_P1).
   - **Name of device to add** (user selectable; for example lp0).

**Sun Solaris 2.x Configuration**

Sun Solaris 2.x uses the lpsystem and lpadmin programs for remote printer configuration:

```
lpsystem -t bsd prnservername
lpadmin -p queue -s prnservername!prnserverservice
accept queue   (not required on newer Solaris systems)
enable queue   (not required on newer Solaris systems)
```

Where `queue` is the name of the local Print/Fax queue.
`prnservername` is the name of the Print/Fax server (must match the entry in the /etc/hosts file or IP address).
`prnserverservice` is the print server BINARY_P1 or TEXT_P1 service.
If this is the first printer configured, you must also use the `lpsched` command prior to the `accept` command.

As an alternative, you may use Printer Manager in the Admintool utility under OpenWindows. Select Edit, Add, and Add Access to Remote Printer. Then enter the Print/Fax server name in the format `prnservername!\prnserverservice` as described above. Make sure that the printer server OS is set to BSD (the default setting), and click Add.

Note that we recommend that you use the `/etc/hosts` file for the printer name rather than NIS or other name services. Also note that due to a bug in the Sun lpd implementation on Solaris 2.4 and earlier releases, you may experience problems printing very long print jobs. If this is the case, a workaround is to use the raw TCP port software as described later in this chapter.

**SCO UNIX Configuration**

To configure a printer in version Version 5.x of SCO Unix, use the SCOADMIN program.

1. Select **Printers** and then **Print Manager**.

2. On the menu select **Printer** and then **Add Remote** followed by **Unix**...

3. Enter the IP address of the Print/Fax server, and type in the name of the printer that will be used to spool to.

4. Deselect **Use External remote Printing Protocol**...

5. To eject the printed page, add the command `rp=lpaf` to the `/etc/printcap` file.
SCO UNIX requires TCP/IP V1.2 or later to work with Imagistics print servers. You must first configure the `/etc/hosts` and `/etc/printcap` files as described in step 2. Then run the sysadmsh program as follows:

1. Select **Printers**.
2. Select **Configure**.
3. Select **Add**.
4. Enter the name of the print queue you entered in the `/etc/printcap` file as the Printer name.
5. Enter anything as the **Comment**, and **Class name**.
6. For the **Use printer interface** select **Existing**.
7. Press the F3 key to get a list of available interfaces, and select the desired one as the **Name of interface** using the cursor keys (Dumb is a good choice).
8. Select **Direct** as the **Connection**.
9. Enter the desired Device name (/dev/lp generally works).
10. Select **Hardwired** as the **Device**.
11. Select **No** for the **Require banner** field.

**Older SCO Unix Systems**
The Imagistics Print/Fax servers support the FTP protocol. Earlier SCO Unix systems are often configured to print using the FTP protocol.

**IBM AS/400**

To use a Imagistics Print/Fax server with an IBM AS/400 running IBM's TCP/IP gateways services for OS/400 (the OS/400 system must be v3.1 or later)

Use the CFGTCP command at your OS/400 prompt to add the Print/Fax server's TCP/IP address to the AS/400 host table.
Use the following one-line OS/400 command to create the LPD queue:

```plaintext
CRTOUTQ OUTQ(<queuename>) RMSTSYS (*INTNETADR) RMTPRTQ(<service>) AUTOSTRWTR(1) CNNTYPE(*IP) DESTDTYPE (*OTHER) MFRTYPMDL (<driver>) INTNETADR('<ipaddress>') TEXT ('<description>')
```

where `<queuename>` is the new AS/400 print queue name, `<service>` is the Print/Fax server service name (BINARY_P1 or TEXT_P1) `<driver>` is the OS/400 printer driver name (*HP4 is recommended if in doubt), and `<ipaddress>` is the IP address of the Print/Fax server. Note that the IP address and description must be enclosed in single quotes.

**Other Systems**

Other systems use similar programs to set up Print/Fax servers. These programs will generally ask for the following information:

<table>
<thead>
<tr>
<th>Requested information:</th>
<th>You should use:</th>
</tr>
</thead>
<tbody>
<tr>
<td>remote printer</td>
<td>Binary or Text service name</td>
</tr>
<tr>
<td>remote host computer name</td>
<td>Any name (must match the name in the printcap file, if any) or in some cases, you may enter the Print/Fax server IP address here</td>
</tr>
<tr>
<td>remote host IP address</td>
<td>IP address of Print/Fax server.</td>
</tr>
</tbody>
</table>

Technical support specialists for these companies can usually answer configuration questions if you provide them with the equivalent UNIX configuration information (tell them that the Print/Fax server looks like a remote UNIX host computer running the lpd line printer daemon).
If you have not created a spool directory for the Imagistics Print/Fax server on your UNIX host computer, you will need to do so now (the printer setup utilities in HP/UX, AIX, Solaris 2.xx, and other systems will automatically create the spool directory). The lpd spool directory is usually located in the /usr/spool directory (check with your system manager to see if the location is different for your system). To create a new spool directory, use the `mkdir` command. For example, to create a spool directory for the queue laser1, you would enter:

```
mkdir /usr/spool/lpd/laser1
```

On some systems it is also necessary to start the daemon. This is done on Berkeley-compatible UNIX systems with the `lpc start` command as shown in the following example:

```
lpc start laser1
```

**Other Sources of Information**

Refer to *chapter 11* of this user guide to learn how to configure the IP address of the printer.
Printing from Windows® NT, Windows® 2000/XP, LAN Server and Warp Server

Overview

Users of Windows® NT can print directly to a network-ready Imagistics machine using the TCP/IP protocol. Microsoft Windows® NT users must install Microsoft’s “TCP/IP Printing“ protocol. Windows® 2000/XP users are able to send print jobs directly to the printer without installing any additional software. Imagistics's print server also supports transparent printing from IBM LAN Server and OS/2 Warp Server file servers, as well as from OS/2 Warp Connect workstations using the TCP/IP protocol.

Quick Tips:

1 The Automatic Private IP Addressing (APIPA) protocol automatically assigns an IP address from the range: 169.254.1.0 to 169.254.254.255. If you want to disable the APIPA protocol, set APIPA to Off using control panel. For more information see page 10-9. If the APIPA protocol is disabled, the default IP address of a Imagistics Print/Fax server is 192.0.0.192. To change it, use the control panel of the machine, the BRAdmin Professional utility or let your DHCP server allocate an IP address to the printer.

2 The default password for Imagistics Print/Fax servers is access.

3 Windows® NT users must install the Microsoft’s “TCP/IP Printing“ protocol.

5 Windows® 95/98/Me users can send print jobs using the IPP protocol via a Windows® 2000/XP computer provided that the Microsoft Internet Print Services software is installed on the client PC, IIS is installed and running on the Windows® 2000/XP computer and that the client PC is using version 4 or later of Microsoft Internet Explorer.

6 The default name for a Imagistics Print/Fax server is usually BRN_xxxxxx (where xxxxxx is the last six digits of the Ethernet address of the Print/Fax server).

Windows® NT 3.5x/NT 4.0/2000/XP (TCP/IP) Configuration

If you have not already done so, install the TCP/IP protocol onto your Windows® NT system. This is done via the Network icon in the Control Panel window of the Windows® NT system (the Control Panel is in the Main window on NT 3.5x systems, or use the Start button on NT 4.0 to access the Settings/Control Panel menu). The default configuration of Windows® 2000/XP automatically installs the TCP/IP protocol. Refer to the appropriate section in this chapter for more information.

Windows® 2000/XP Printing (Printer Driver not yet installed)

By default, Windows® 2000/XP systems install with all the necessary software required for you to be able to print. This chapter describes the two most commonly used configurations, Standard TCP/IP Port printing and IPP (Internet Printing Protocol). If you have already installed the printer driver, jump to the printer driver already installed section.

Standard TCP/IP Port Printing

1 From the Printers folder select Add Printer. The Add Printer Wizard will now start. Click on Next.

2 Now select the Local Printer option and deselect the Automatically detect and install my Plug and Play printer option.
3 Click on **Next**.

4 You must now select the correct Network printing port. Select **Create a new port** and select **Standard TCP/IP Port** port from the pull-down window.

5 When you have done that click **Next**.

6 The **Add Standard TCP/IP Port Wizard** will now appear. Click the **Next** button.

7 Enter the IP address, or name of the printer you wish to configure. The Wizard will automatically enter the Port name information for you.

8 Click the **Next** button.

9 Windows® 2000/XP will now contact the printer that you specified. If you did not specify the correct IP address or name then you will receive an error message.

10 Click the **Finish** button to complete the Wizard.

11 Now that you have configured the port, you must specify which printer driver you wish to use. Select the appropriate driver from the list of supported printers. If you are using a driver supplied with the machine on CD-ROM then select the **Have Disk** option to browse to the CD-ROM. You can also click the **Windows Update** button to connect directly to Microsoft's support Web site to download printer drivers.

12 When the driver is installed, click the **Next** button.

13 Specify a name and click the **Next** button.

14 Now specify if you wish to share the printer, enter the share name and click **Next**.

15 Continue through the Wizard clicking the **Finish** button when complete.
IPP Printing from Windows® 2000/XP Clients

If you wish to print using the IPP protocol, follow these steps:

1. From the Printers folder select Add Printer. The Add Printer Wizard will now start. Click on Next.

2. For Windows® 2000: Select Network Printer. For Windows® XP: Select A Network Printer, or a Printer attached to another computer.

3. For Windows® 2000: Click the Connect to a printer on the Internet or on your intranet option. For Windows® XP: Click the Connect to a printer on the Internet or on a home or office network option.

4. You must now enter a URL name. A typical example of a URL name for a printer that supports the IPP protocol is: http://ip_address:631/ipp (where ip_address is the IP address, NetBIOS name or DNS name of the Print/Fax server).

5. Click the Next button.

6. Windows® 2000/XP will now connect to the device that you specified and determine the model number of the printer. If the appropriate driver is installed on the PC, it will be used. If the appropriate driver is not available you will be asked to insert the driver diskette that was supplied with the printer.

7. Follow the Wizard through to the end of the installation.

8. Click the Finish button to complete the Wizard.

IPP printing from Windows® 95/98/Me Clients

It is also possible to send IPP print jobs from a Windows® 95/98/Me client PC, provided that the PC has the ability to connect to and access Windows® 2000/XP resources. Visit the Microsoft web site (www.microsoft.com) and download the Windows® Internet Print Services support software for Windows® systems.

Once installed, this software will allow you to connect to a Windows® 2000/XP system that is also running IIS and send print jobs using the IPP protocol.
By using Microsoft's IPP software you can also send jobs to other printers that do not support the IPP protocol.

**Windows® 2000/XP Printing (Printer Driver already installed)**

If you have already installed the printer driver and wish to configure it for network printing, follow these steps:

1. Select the printer driver you wish to configure.
2. Select File and then choose Properties.
3. Click the Ports tab of the driver and click Add Port.
4. Select the port that you wish to use. Typically this would be Standard TCP/IP Port. Then click the New Port... button.
5. The standard TCP/IP Port Wizard will start. Follow steps 6-10 of the “Standard TCP/IP Port Printing” section.

**Windows® NT 4.0 Printing**

If you did not install the TCP/IP protocol during the installation of your Windows® NT 4.0 system (either workstation or server) follow these steps. If you have already installed the TCP/IP protocol, proceed to the next section.

1. Go to the Start button, choose Settings, and then select Control Panel.
2. Run the Network applet by double clicking the Network icon and then click on the Protocols tab.
3. Select Add, and double click on the TCP/IP Protocol.
4. Insert the requested disk(s), or CD-ROM, to copy the required files.
5. Click the Close button. The Windows® NT system will review protocol bindings and then you will see the TCP/IP Properties dialog.
Configure the host IP address, subnet mask, and gateway address in that dialog. Consult your system manager for these addresses.

Click **OK** to exit (your NT workstation or server will need to be re-booted).

**Windows® NT 4.0 Printing**

**Installing the Imagistics Peer to Peer Software**

1. Start the CD-ROM installation menu program according to the Quick Setup Guide.

2. Select the desired Language and then select **Install Software**. Then select the **Network Print Software** installation program.

3. Click on **Next** in response to the Welcome message.

4. Select the **Imagistics Peer to Peer Print (LPR)** button.

5. Select the desired directory to install the **Imagistics Peer to Peer Print (LPR)** files and click on **Next**. The installation program will create the directory for you if it does not already exist on your disk.

6. Enter the Port name that you wish to use and click **OK**. The default port name is BLP1. Whichever name you choose, it must be unique and it MUST begin with BLP.

7. You must now enter the actual IP address of the print server in the IP Address field. If you have edited the hosts file on your computer or are using Domain Name System, you can also enter the name of the print server. As the print server supports TCP/IP and NetBIOS names, you can also enter the NetBIOS name of the print server. The NetBIOS name can be seen in the network configuration page. By default the NetBIOS name will appear as **BRN_xxxxxx** where **xxxxxx** is the last six digits of the Ethernet address.

8. Click the **OK** button. When prompted you must re-boot your computer.
Windows® NT 4.0 Printing
Associating to the Printer

You must now create a printer on your Windows® system using the standard Windows® printer setup procedure.

1 To do this, go to the Start button, select Settings and then Printers.

2 Double click the Add Printer icon to get the Add Printer Wizard.

3 Select My Computer (not Network Printer) and click on Next.

4 Select the Imagistics LPR Port (the port name you assigned in step 6 of the “Installing Imagistics Peer to Peer Software” section in this chapter) and click on Next.

5 Select the desired printer model. If the correct model is not displayed, click on the Have Disk option and insert the CD-ROM supplied with your printer.

6 If the driver already exists, select Keep Existing Driver (if it does not exist, this step will be skipped), and then click on Next.

7 If desired, change the name of the printer then click Next.

8 If desired, make the printer shared (so other user can access it), and select the operating system(s) that these other computers will be running. Click on Next.

9 Select Yes when you asked Would you like to print a test page?. Click on Finish to complete the installation. You may now print to the printer as if it were a local printer.
Windows® NT 4.0 Printing
Adding a Second Imagistics LPR Port

You do not need to re-run the install program to add a new Imagistics LPR port. Instead, press the Start button, select Settings, and open the Printers window. Click on the icon of the printer that you wish to configure, select File from the menu bar, and then choose Properties. Click on the Ports tab and push the Add Port button. In the Printer Ports dialog, highlight Imagistics LPR Port. Click the New Port button and enter the port name. The default port name is BLP1. If you have already used this name, you will get an error message if you try to use it again, in which case use BLP2, etc... Once you have specified the port name, click the OK button. You will then see the Port Settings dialog.

Enter the IP address of the printer that you wish to print to and click OK. And then click Close in the Printer Ports dialog. You should now see the port that you have just created in the Print to the following port(s) setting of the printer driver.

Other Sources of Information

Refer to chapter 11 of this user guide to learn how to configure the IP address of the machine.
Peer to Peer Printing

How to Print in a Windows® 95/98/Me Peer to Peer network

Overview

Microsoft's Windows® 95/98/Me operating systems feature built-in networking capabilities. These capabilities allow a Windows® PC to be configured as a client workstation in a file server based network environment.

For smaller networks, Windows® 95/98/Me also allows the PC to operate in a peer-to-peer mode. In this mode, the PC can share resources with other PCs on the network without the need for a central file server.

Quick Tips:

1. The Automatic Private IP Addressing (APIPA) protocol automatically assigns an IP address from the range: 169.254.1.0 to 169.254.254.255. If you want to disable the APIPA protocol, set APIPA to Off using control panel. For more information see page 10-9. If the APIPA protocol is disabled, the default IP address of a Imagistics Print/Fax server is 192.0.0.192. To change it, use the control panel of the machine, the BRAdmin Professional utility or let your DHCP server allocate an IP address to the printer.

2. Refer to chapter 11 of this user guide to learn how to configure the IP address on your machine.

3. The default password for Imagistics Print/Fax servers is access.

4. Imagistics printers are also compatible with HP JetDirect software, this means that you can use HP utilities to manage and to print to your Imagistics printer.
TCP/IP Printing

Our Peer to Peer printing software requires the TCP/IP protocol to be installed on your Windows® peer-to-peer computers and an IP Address has to be defined for the Print/Fax server. Refer to your Windows® documentation for more information on how to configure the TCP/IP protocol on your Windows® PC.

If you haven’t already done so, configure the IP address of the machine, for more information on IP address configuration, refer to chapter 11 of this user guide.

Installing the Imagistics Peer to Peer Software

If you already installed the driver from the printer’s CD-ROM Installer and you selected “Imagistics Peer-to-Peer Network Printer” during the installation then you do not need to install the Imagistics Network Print Software again.

1 Start the CD-ROM installation menu program according to the Quick Setup Guide.

2 Select the proper model and then the Software Installation menu. Then select the appropriate menu to start the Imagistics Network Print Software installation program.

3 Push the Next button in response to the Welcome message.

4 Select the Imagistics Peer to Peer Print (LPR) button.

5 Select the desired directory to install the Imagistics Peer to Peer Print (LPR) files and push Next. The installation program will create the directory for you if it does not already exist on your disk.

6 Enter the Port name that you wish to use and click OK. The default port name is BLP1. Whichever name you choose, it must be unique and it MUST begin with BLP.

7 You must now enter the actual IP address of the Print/Fax server in the Printer name or IP address field. If you have edited the hosts file on your computer or are using Domain
Name System, you can also enter the name of the print server. As the Print/Fax server supports TCP/IP and NetBIOS names, you can also enter the NetBIOS name of the Print/Fax server. The NetBIOS name can be seen in your network configuration page. By default the NetBIOS name will usually appear as BRN_xxxxxx where xxxxxx is the last six digits of the Ethernet address.

Windows® 95/98/Me store the hosts file in the default Windows® directory. By default, the Windows® hosts file is called hosts.sam. If you wish to use the hosts file you must rename the file to hosts with no extension. The .sam extension stands for sample.

8 Click the OK button. When prompted you must re-boot your computer.

**Associating to the printer**

You must now create a printer on your Windows® system using the standard Windows® printer setup procedure.

1 To do this, go the Start button, select Settings and then Printers.

2 Select Add Printer to begin the printer installation.

3 Click Next when you get the Add Printer Wizard window.

4 Select Local Printer when you are asked how the printers are connected to your computer, and then push Next.

5 Select the correct driver. Click Next when you are done.

6 If you have selected a printer driver that is already being used, you have the option of either keeping the existing driver (recommended) or replacing it. Select the desired option and press Next.

7 Select the Imagistics LPR port (the port name you assigned in step 6 of the “Installing the Imagistics Peer to Peer Software” section) and press Next.
8 Enter any desired name for the Imagistics printer and press Next. For example, you could call the printer “Networked Imagistics Printer”.

9 Windows® will now ask you if you wish to print out a test page, select Yes and then select Finish.

You have now finished installing the Peer to Peer Print (LPR) software.

**Adding a Second Imagistics LPR Port**

You do not re-run the install program to add a new Imagistics LPR port. Instead, press the Start button, select Settings, and open the Printers window. Click on the icon of the printer that you wish to configure, select File from the menu bar, and then choose Properties. Click on the Details tab and push the Add Port button.

In the Add Port dialog, select the Other radio button and then highlight Imagistics LPR port. Click OK and enter the port name. The default port name is BLP1. If you have already used this name, you will get an error message if you try to use it again, in which case use BLP2, etc... Once you have specified the port name, click the OK button. You will then see the Port Properties dialog.

Enter the IP address of the printer that you wish to print to and click OK. You should now see the port that you have just created in the Print to the following port setting of the printer driver.

**Other Sources of Information**

Refer to chapter 11 of this user guide to learn how to configure the IP address of the machine.
How to Print using NetBIOS in Windows® 95/98/Me/NT/2000/XP, LAN Server and OS/2 Warp Server

Overview

Imagistics Print/Fax server range supports SMB (Server Message Block) over the TCP/IP protocol via the NetBIOS interface. This means that just like regular Windows® PC's, Imagistics machine can appear in your network neighborhood. The main advantage of NetBIOS printing is that you are able to print from legacy DOS applications that are running on PC's that are connected to Microsoft networks.

Quick Tips:

1. The Automatic Private IP Addressing (APIPA) protocol automatically assigns an IP address from the range: 169.254.1.0 to 169.254.254.255. If you want to disable the APIPA protocol, set APIPA to Off using control panel. For more information see page 10-9. If the APIPA protocol is disabled, the default IP address of a Imagistics Print/Fax server is 192.0.0.192. To change it, use the control panel of the machine, the BRAdmin Professional utility or let your DHCP server allocate an IP address to the printer.

2. Refer to chapter 11 of this user guide to learn how to configure the IP address on your printer.

3. The default password for Imagistics Print/Fax servers is access.

4. The default domain name of the Print/Fax server is WORKGROUP, to change it use your web browser or the BRAdmin Professional utility.
Print Server Configuration

In order for this function to work, you must correctly change the DOMAIN name or WORKGROUP name to match that of your network. Once this is done, the Print/Fax server will appear automatically in your network neighborhood and you will be able to send print documents to it without having to install additional software. However, in some instances you may find that your Windows® 95/98/Me and Windows® NT4.0/2000/XP systems may receive “Printer is busy” error messages when more than one person attempts to access the printer. In this instance Imagistics has provided the “Imagistics NetBIOS Port Monitor” software which allows users to continue spooling print jobs while the printer is busy, down or out of paper. The port monitor will hold the jobs until the printer is again available.

When you install Windows® 95/98/Me you are asked which workgroup you belong to. The default workgroup name for Windows® 95/98/Me is WORKGROUP, however you could change this to anything you want. With Windows® NT, Microsoft introduced the concept of “Domains”. A domain offers centralized security management whereas a workgroup offers distributed security management. The Print/Fax server does not care if your network consists of a Workgroup or a Domain, the only thing you must tell it is the name of the workgroup or domain. The Imagistics Print/Fax server automatically has a default workgroup/domain name of WORKGROUP. If you need to change name, you can configure the Imagistics print server to recognize this. There are three ways of doing this. (If you are unsure about the name of your workgroup or domain, look in the identification tab in your network applet).

- Use BRAdmin Professional utility (This utility can use the TCP/IP protocol or Netware IPX protocol - no file server necessary.)
- Use a Web browser (the Print/Fax server must have a valid IP address and your computer must also have a valid IP address); you can configure the IP address by using BRAdmin Professional utility.
- Use front panel on the machine. (See chapter 10.)
Because of the way that Microsoft networks work, the Print/Fax server may take several minutes to appear in the network neighborhood. You will also find that the Print/Fax server may take several minutes to disappear from the network neighborhood even if the printer is switched off. This is a feature of Microsoft workgroup and domain based networks.

**Changing the workgroup/domain name using a web browser**

You can change the workgroup/domain name using BRAdmin Professional utility. To do this press NetBIOS tab and then enter your workgroup/domain name into the **Domain Name** text box.

You can also use a standard WWW browser to change the NetBIOS name. To do this, connect to the print server using its IP address and then select the **Configure NetBIOS** option from the **Network Configuration** screen, then enter your workgroup/domain name into the **Domain Name** text box. Make sure you submit the changes (click on the **Submit** button).
NetBIOS Port Monitor for Windows® 95/98/Me, NT4.0/2000/XP

This software requires the TCP/IP transport protocols to be installed on your Windows® 95/98/Me, NT4.0/2000/XP computer. To install those protocols refer to your Windows® documentation. If you are using the TCP/IP protocol, the proper IP address should be defined on both the Imagistics Print/Fax server and your client PC.

Installing the Imagistics NetBIOS Port Monitor

If you already installed the driver from the printers CD-ROM Installer and you selected “Imagistics Peer to Peer Network Printer” during the installation then you do not need to install the Imagistics Network Print Software again.

1 Start the CD-ROM installation menu program according to the Quick Setup guide.

2 Select the proper model and then the Software Installation menu. Then select the Network Print Software menu to start the Imagistics Network Print Software installation program.

3 Push the Next button in response to the Welcome message.

4 Select Imagistics Peer to Peer Print (NetBIOS) installation.

5 Select the desired directory to install the Imagistics Peer to Peer Print (NetBIOS) files and push Next.

6 Enter the port name that you wish to use. The port name must start with “BNT”. For example BNT1. Whichever name you choose, it must be unique. Then press OK. The name must be unique on your PC, however other computers can use the same port name as the name you specify on your PC.
7 You must now enter the server name and port name for the actual Print/Fax server. You can use the Browse button to search for the Print/Fax server, select the domain/workgroup name, and then the server is listed. If the print server does not automatically appear in your browse list, then you must ensure that the domain name is configured correctly. Otherwise you must enter the name manually. The name should be compliant with UNC (Universal Name Convention). For example: \\NodeName\ServiceName.

Where NodeName is the NetBIOS name of the Imagistics Print/Fax server (the default name is usually BRN_xxxxxxx, where xxxxxxx is the last six digits of the Ethernet address), and ServiceName is the service name for NetBIOS of the Print/Fax server. By default it is BINARY_P1. For example:

\\BRN_310107\BINARY_P1

💡 You can find the NetBIOS name and MAC address by printing out the network configuration page. Refer to “Resetting the Print/Fax Server back to factory settings (Test Switch)” on page 14-4 how to print the network configuration page on your Print/Fax server.

8 Then press OK.

9 Click the Finish button. You must now restart your computer before you can continue.

**Associating the printer**

1 You must now create a printer on your Windows® 95/98/Me, Windows NT® 4.0 and Windows® 2000/XP systems using the standard Windows® printer setup procedure. To do this, go the Start button, select Setting and then Printers.

**Windows® 95/98/Me**

2 Select Add Printer to begin the printer installation.

3 Click Next when you get the Add Printer Wizard window.
4 Select **Local Printer** when you are asked how the printer is connected to your computer, and then push **Next**.

5 Select the correct driver. Click **Next** when you are done.

6 If you have selected a printer driver that is already being used, you have the option of either keeping the existing driver (recommended) or replacing it. Select the desired option and press **Next**.

7 Select the **Imagistics NetBIOS Port** (the port name you assigned in step 6 of the “Installing the Imagistics NetBIOS Port Monitor” section and press **Next**.

8 Enter any desired name for the Imagistics machine and press **Next**. For example, you could call the printer “Networked Imagistics Printer”.

9 Windows® will now ask you if you wish to print out a test page, select **Yes** and then select **Finish**.

You are now ready to print. If necessary, you can share the printer on your PC so that all print jobs are routed through your computer.

**Windows NT® 4.0 /Windows® 2000/XP**

2 Select **Add Printer** to begin the printer installation.

3 Click **Next** when you get the **Add Printer Wizard** window.

4 Select **Local printer** (Windows® 2000) or Local printer attached to this computer (Windows® XP) when you are asked how the printer is connected to your computer, and then push **Next**.

5 Select the **Imagistics NetBIOS Port** (the port name you assigned in step 7 of the “Installing the Imagistics NetBIOS Port Monitor” section and press **Next**.

6 Select the correct driver. Click **Next** when you are done.
7 If you have selected a printer driver that is already used, you have the option of either keeping the existing driver (recommended) or replacing it. Select the desired option and press **Next**.

8 Enter any desired name for the Imagistics machine and press **Next**. For example, you could call the printer “Networked Imagistics Printer”.

9 Select **Not Shared** or **Shared** and **Share Name** and press **Next**.

10 Windows® will now ask you if you wish to print out a test page, select **Yes** and then select **Finish**.

You are now ready to print. If necessary, you can share the printer on your PC so that all print jobs are routed through your computer.

### Adding a Second NetBIOS Print Port

1 You do not need to re-run the installation program to add a new NetBIOS port. Instead, press the **Start** button, select **Settings**, and open the **Printers** window. Click on the icon of the printer that you wish to configure, select **File** from the menu bar, and then choose **Properties**.

Windows® 95/98/Me

2 Click on the **Details** tab and push the **Add Port** button. In the **Add Port** dialog, select the **Other** radio button and then highlight **Imagistics NetBIOS port**. Click **OK** and enter the port name. The default port name is BNT1. If you have already used this name, you will get an error message if you try to use it again, in which case use BNT2, etc... Once you have specified the port name, click the **OK** button. You will then see the **Port Properties Dialog**. Enter the Print/Fax server and port name of the printer that you wish to print to and click **OK**. You should now see the port that you have just created in the **Print to the following port** setting of the printer driver.
Windows NT® 4.0 / Windows® 2000/XP

2 Click on the Port/s tab and push the Add Port button. In the Add Port dialog, highlight Imagistics NetBIOS port. Click New Port and enter the port name. The default port name is BNT1. If you have already used this name, you will get an error message if you try to use it again, in which case use BNT2, etc. Once you have specified the port name, click the OK button. You will then see the Port Properties Dialog. Enter the Print/Fax server and port name of the printer that you wish to print to and click OK. You should now see the port that you have just created in the Print to the following port setting of the printer driver.

Other Sources of Information

Refer chapter 11 of this user guide to learn how to configure the IP address of the machine.
Internet Printing Installation

Overview

Imagistics Internet Print (BIP) software, for Windows® 95/98/Me/NT4.0, allows a PC user at one location to send a print job to a Imagistics machine at a remote location via the Internet. For example, a user on a PC in New York could print a document directly from his Microsoft Excel application program to a printer in Paris.

Windows® 2000/XP users can also use this BIP software, but are recommended to use the IPP protocol support that is part of the Windows® 2000/XP operating systems. Skip to the “Windows® 2000 IPP Printing” section of this document.

Quick Tips:

1 The Automatic Private IP Addressing (APIPA) protocol automatically assigns an IP address from the range: 169.254.1.0 to 169.254.254.255. If you want to disable the APIPA protocol, set APIPA to Off using control panel of the machine. For more information see page 10-9. If the APIPA protocol is disabled, the default IP address of a Imagistics Print/Fax server is 192.0.0.192. To change it, use the control panel of the machine, the BRAdmin Professional utility or let your DHCP server allocate an IP address to the machine.

2 Refer to chapter 11 of this user guide to learn how to configure the IP address on your printer.

3 The default password for Imagistics Print/Fax servers is access.

Windows® 95/98/Me users can send print jobs using the IPP protocol via Windows® 2000 computer, provided that the Microsoft Internet Print Services software is installed on the client PC, Internet Information Server (IIS) is installed and running on the server and that the client PC is using version 4 or later of Microsoft Internet Explorer.

Imagistics Internet Print General Information

The BIP software is installed using a standard Windows® 95/98/Me/NT4.0/2000/XP Installation Wizard. It creates a virtual port on the Windows® 95/98/Me/NT4.0/2000/XP PC that operates in a similar way to the standard LPT1 printer port from the application program point of view. The user can use the Windows® 95/98/MeNT4.0/2000/XP Print Manager to create a printer that uses this port along with a standard Windows® 95/98/Me, NT4.0/2000/XP-compatible printer. Any Windows® 95/98/Me/NT4.0/2000/XP applications program can therefore print to this printer (and hence to the virtual port) without modification or operational procedure.

When a job is printed to the BIP virtual port, it is actually MIME-encoded (converted to a standard Internet E-mail message) and sent out to a Imagistics Print/Fax server at the remote location. This means that BIP is compatible with most common E-mail software packages. The only requirement is that the E-mail server be capable of sending E-mail message over the Internet.

In more detail, the procedure works in the following way:

- If you are connected to a Local Area Network, the E-mail message is passed to the E-mail server, which in turn transmits the message out over the Internet using the SMTP protocol (Simple Mail Transport Protocol) to the remote Print/Fax server.

- If you are connecting via a modem directly to an Internet Service Provider (ISP), the ISP handles the routing of the E-mail to the remote Print/Fax server.
At the remote site, an E-mail server receives the E-mail message. The remote Print/Fax server, which has its own E-mail address, uses the POP3 protocol (Post Office Protocol 3) to download the E-mail message from the E-mail server. It then decodes the attachment and prints it out on the printer.

If an E-mail is received that has not been configured to use the BIP virtual port driver, the printer will print the E-mail out as a text document.

### Imagistics Internet Print Configuring the Imagistics Print/Fax Server

The Print/Fax server can be configured using BRAdmin Professional utility or by using a web browser.

### Print Server Configuration Checklist

Before configuring the print server to receive BIP jobs, be sure that the E-mail server at the remote site (the receiving end) is configured to handle the TCP/IP POP3, and SMTP protocols (SMTP is only required if the notification feature is enabled).

1. Configure the POP3 server on the E-mail server at the remote site with a mail account (Mailbox name) and password for the Imagistics Print/Fax server (generally, the mail account name will be the first part of the Email address; for example, if you assign the E-mail address emailprinter@xyz.com, then the mail account name would be emailprinter).

2. Make sure that the Print/Fax server is installed and running with TCP/IP enabled and has a valid IP address assigned to it.

Because access to the E-mail server on most networks is usually restricted, you may need to have your network administrator check the configuration and add the mail account.
Imagistics Internet Print
Using BRAdmin Professional utility to Configure the Print Server

Skip this section if you wish to use the Web Browser to configure the Print/Fax server.

Using the BRAdmin Professional utility, you can configure the Imagistics print server using the TCP/IP protocol, or the IPX protocol.

The steps required to configure the Print/Fax server to receive print jobs from a Windows® 95/98/Me/NT4.0/2000/XP. PC running the BIP software is as follows:

1 Start BRAdmin Professional utility.

2 Select the node name of the desired Imagistics Print/Fax server from the list and double click on it. (the default node name is usually BRN_xxxxxx, where xxxxxx is the last six digits of the Ethernet address (MAC address)). You will be prompted for a password; the default password is access.

You can find the node name and MAC address by printing out the network configuration page. Refer to “Resetting the Print/Fax Server back to factory settings (Test Switch)” on page 14-4 how to print the network configuration page on your Print/Fax server.

3 Click on the POP3/SMTP tab.

4 Enter the address of the POP3 server (consult your network administrator if you do not know this address).

5 Enter the mailbox name for the remote Imagistics Print/Fax server. Usually this will be the first part of the E-mail address (for example, if the E-mail address of the print server is emailprinter@xyz, then the mailbox name would be emailprinter).
6 Enter the password for the mailbox, if any.

7 The Print/Fax server is configured by default to poll the POP3 server every 600 seconds (10 minutes). You may change this value, if desired.

8 If you have enabled notification, enter the address of your SMTP server (consult your network administrator if you do not know this address).

9 Press the OK button and save the changes. Now exit the BRAdmin Professional utility. You have now configured the Print/Fax server to receive print jobs.

Imagistics Internet Print
Using a Web Browser to configure the Print Server

1 Connect to the printer server IP address using your web browser.

2 When you reach the network configuration screen, you will be prompted for a password. The default password is “access”.

3 Select the Configure POP3/SMTP option and enter the information as described above. Refer to “Imagistics Internet Print Using BRAdmin Professional utility to Configure the Print Server”.

4 You should see a Segmented Message Timeout option. If a print job is separated into multiple E-mail messages using the Partial E-mail Print feature of the BIP, this value indicates how long the Print/Fax server will wait for all of the segments of the message to arrive.

Imagistics Internet Print
Installing the BIP software on Windows® 95/98/Me/NT4.0/2000/XP

To install the BIP software on a Windows® 95/98/NT4.0/2000/XP PC, execute the following steps:
Setup from CD-ROM

1 Start the CD-ROM installation menu program according to the Quick Setup guide.

2 Select the proper model and Software Installation menu. Then select the Network Print Software menu to start the Network Print Software installation program.

3 Push the Next button in response to the Welcome message.

4 Select the Imagistics Internet Print button.

5 Select the desired directory to install the BIP files and then push Next. The installation program will create the directory for you if it does not already exist.

6 You will then be asked for a port name. Enter the name of the port. The port name must begin with the BIP and end with a number, for example, BIP1.

7 You will then see a message about Partial E-mail Print. Partial E-mail Print is the ability of the Imagistics Internet Print software to break down E-mail Print jobs into smaller sections to prevent a mail file size limitation problem for the mail server.

8 Press OK to continue.

Be sure that the PC is running an E-mail program (for example, Microsoft Outlook) that is capable of sending E-mail message using Winsock.

Be sure that your E-mail server is capable of sending messages across the Internet.
9 You will then be asked to enter the port settings for the remote Print/Fax server:

Enter any unique legal Internet E-mail address for the remote Print/Fax server (for example emailprinter@xyz.com). Note that Internet E-mail addresses cannot have spaces in them.

Enter your E-mail address and the IP address of your SMTP E-mail server (consult your network administrator if you do not know this address). Also specify if you are going to use the Partial E-mail Print option and the Notification type.

10 Press OK to continue. You will then be asked to re-start your computer.

11 Once your computer has re-started you must create a printer on your Windows® 95/98/Me/NT4.0/2000/XP system using the standard Windows® 95/98/Me/NT4.0/2000/XP printer setup procedure. To do this, go the Start button, select Settings and then Printers (Windows® 95/98/Me/NT4.0/2000/XP). To do this, go to the Control Panel, select Printers and Other Hardware and then Printers and Faxes (or Add a printer)(Windows® XP)

12 Select Add Printer to begin the printer installation.

13 Click Next when you get the Add Printer Wizard window.

<For Windows® 95/98/Me users>

14 Select Local Printer when you are asked how the printers are connected to your computer and push Next.

<For Windows® NT4.0/2000/XP users>

14 Select Local Printer, and then delete the check mark in Plug and Play check box.

<For Windows® XP users>

14 Select Local Printer attached to this computer.
<For Windows® 95/98/Me users>

15 Select the desired model of the remote printer (for example, Imagistics ix2700). If necessary, click Have Disk to load the driver from the CD-ROM. Click Next when you are done.

16 If you have selected a printer driver that is already being used, you have the option of either keeping the existing driver (recommended) or replacing it. Select the desired option and press Next.

17 Select the Imagistics Internet port (BIP...) which you selected in step 6 and press Next.

<For Windows® NT4.0/2000/XP users>

15 Select the Imagistics Internet port (BIP...) which you selected in step 6 and press Next.

16 Select the desired model of the remote printer (for example, Imagistics ix2700). If necessary, click Have Disk to load the driver from the CD-ROM. Click Next when you are done.

17 If you have selected a printer driver that is already being used, you have the option of either keeping the existing driver (recommended) or replacing it. Select the desired option and press Next.

18 Enter any desired name for the BIP remote printer and press Next. Note that this name does not need to match the port name that you assigned in step 6, or E-mail address that you assigned in step 9.

19 Select No when asked if you want to print a test page, unless you have already configured the remote Print/Fax server to receive BIP print jobs.

You have now finished installing the BIP software. If you need to configure another remote Print/Fax server, go to the next section, “Adding a Second Imagistics Internet Port”.
Adding a Second Imagistics Internet Port

You should not re-run the install program to add a new Imagistics Internet Port. Instead, press the Start button, select Settings, and open the Printers window. Click on the icon of a printer that is using BIP, select File from the menu bar, and then choose Properties. Click on the Details (Ports on Windows® NT) tab and push the Add Port button.

In the Add Port dialog, select the Other radio button (Windows® 95/98/Me only) and then Imagistics Internet Port. Click OK (New Port on Windows® NT) and it will give you the Port Name text box. Any unique name can be given here as long as it starts with “BIP” and another port does not already exist with the same name.

Windows® 2000/XP IPP Printing

Use the following instructions if you wish to use the IPP printing capabilities of Windows® 2000/XP.

1 Run the Add Printer Wizard and click the Next button when you see the Welcome to the Add Printer Wizard screen.

2 You are now able to select Local Printer or Network Printer. For Windows® 2000: Make sure that you select Network Printer. For Windows® XP: Make sure that you select A Network Printer, or a Printer attached to another computer.

3 You will see the Add Printer Wizard screen.

4 For Windows® 2000: Select Connect to a printer on the Internet or on your intranet and then enter the following in the URL field: http://printer_ip_address:631/ipp (Where printer_ip_address is the IP address or DNS name of your printer).

For Windows® XP: Select Connect to a printer on the Internet or on a home or office network and then enter the following in the URL field: http://printer_ip_address:631/ipp (Where printer_ip_address is the IP address or DNS name of your printer).
5 When you click **Next**, Windows® 2000/XP will make a connection with the URL that you specified.

**IF THE PRINTER DRIVER HAS ALREADY BEEN INSTALLED**

If the appropriate printer driver is already installed on your PC, Windows® 2000/XP will automatically use that driver for use. In this case, you will simply be asked if you wish to make the driver the default driver, after which the Driver installation Wizard will complete. You are now ready to print.

**IF THE PRINTER DRIVER HAS NOT BEEN INSTALLED**

One of the benefits of the IPP printing protocol is that it establishes the model name of the printer when you communicate with it. After successful communication you will see the model name of the printer automatically. This means that you do not need to inform Windows® 2000 the type of printer driver to be used.

6 Click **OK**. You will then see the printer selection screen in the **Add Printer Wizard**.

7 If your printer is not in the list of supported printers, click the **Have Disk** button. You will then be asked to insert the driver disk.

8 Click the **Browse** button and select the CD-ROM or network share that contains the appropriate Imagistics printer driver.

9 Now specify the model name of the printer.

10 If the printer driver that you are installing does not have a Digital Certificate you will see a warning message. Click **Yes** to continue with the installation. The **Add Printer Wizard** will then complete.

11 Click the **Finish** button and the printer is now configured and ready to print. To test the printer connection, print a test page.
Specifying a different URL

Please note that there are several possible entries that you can enter for the URL field.

http://printer_ip_address:631/ipp
This is the default URL and we recommend that you use this URL. Please note the Get More Info option will not display any printer data.

http://printer_ip_address:631/ipp/port1
This is for HP JetDirect compatibility. Please note the Get More Info option will not display any printer data.

http://printer_ip_address:631/
If you forget the URL details, you can simply enter the above text and the printer will still receive and process data. Please note the Get More Info option will not display any printer data.

If you are using the built in service names that the Imagistics Print/Fax server supports, you can also use the following: (However, please note the Get More Info option will not display any printer data).

http://printer_ip_address:631/brn_xxxxxx_p1
http://printer_ip_address:631/binary_p1
http://printer_ip_address:631/text_p1
http://printer_ip_address:631/postscript_p1
http://printer_ip_address:631/pcl_p1
http://printer_ip_address:631/brn_xxxxxx_p1_at

Where printer_ip_address is the IP address of the printer.

Other Sources of Information

1 Visit Microsoft’s web site for the “Microsoft Internet Print Services” software for Windows® 95/98/Me.

2 Refer to chapter 11 of this user guide to learn how to configure the IP address of the machine.
How to configure Novell NetWare Printing

Overview

Imagistics Print/Fax servers allow NetWare client PCs to print jobs on the same printer as TCP/IP or other network protocol users. All NetWare jobs are spooled through the Novell server and delivered to the printer when it is available.

Quick Tips:

1. The Automatic Private IP Addressing (APIPA) protocol automatically assigns an IP address from the range: 169.254.1.0 to 169.254.254.255. If you want to disable the APIPA protocol, set APIPA to Off using control panel. For more information see page 10-9. If the APIPA protocol is disabled, the default IP address of a Imagistics Print/Fax server is 192.0.0.192. To change it, use the control panel, the BRAdmin Professional utility or let your DHCP server allocate an IP address to the machine.

2. The default password for Imagistics Print/Fax servers is access.
General Information

In order to use a Imagistics Print/Fax server on a NetWare network, one or more file servers must be configured with a print queue that the Print/Fax server can service. Users send their print requests to the file server's print queue, and the jobs are then spooled (either directly, or in the case of remote printer mode, via an intermediate NetWare print server) to the appropriate Imagistics Print/Fax server.

The system administrator can create Bindery (NetWare 3), NDS (NetWare 3 and NetWare 4) based queues in a single environment without having to switch between applications by using the BRAdmin Professional utility.

NetWare 5 users wishing to configure an NDPS printer must use the NWADMIN application supplied with NetWare 5. Please note that it is possible to create IPX BINDERY or NDS based queues on a NetWare 5 system using the BRAdmin Professional utility.

You must install the Novell NetWare Client 32 if you wish to create queue information on your NetWare servers using the BRAdmin Professional utility.

If you can't use the BRAdmin Professional utility in your environment, you can create the queue using the traditional NetWare PCONSOLE utility or NWADMIN utilities, but you will then also need to use a WWW browser to configure the Print/Fax server.

Imagistics Print/Fax servers can service up to 16 file servers and 32 queues.
Creating a NDPS Printer Using NWADMIN for NetWare5

With NetWare 5, Novell has released a new preferred printing system called Novell Distributed Print Services (NDPS). Before the Print/Fax server can be configured, NDPS must be installed on the NetWare 5 server and an NDPS Manager configured on the server.

For further information regarding NDPS printers and printing please refer to the “Other Sources of Information” section at the end of this chapter.

NDPS Manager

This creates a NDPS manager that interacts with services running at the server and manages an unlimited number of printer agents.

You have to create an NDPS manager within an NDS tree before creating server-based printer agents. If the NDPS manager controls a printer attached directly to the server, you must load the manager on the server that the printer is attached to.

1 In NetWare administrator, navigate to the area you want the NDPS manager to reside. Select Object | Create | NDPS Manager and click OK.

2 Enter an NDPS manager name.

3 Browse to a server (which has NDPS installed but no NDPS manager installed) where you want to install the NDPS manager and then to the volume you want the NDPS manager database assigned to. Click create.
NDPS Broker

When NDPS is installed, an NDPS broker is loaded onto the network. One of the Broker services Resource Management Service allows Printer Drivers to be installed onto the server for use with Printer Agents.

To add a Printer Driver to the Broker:

1. Make sure the Resource Management Service is enabled.
2. Open the Broker Object’s main window in NetWare Administrator.
4. The Resource Management dialog appears. Select the Add Resources button.
5. When the Manage Resources dialog appears, select the icon for the type of driver you want to add. This will be a 3.1x, 95/98/Me or NT4.0 driver for NetWare 5 (Additionally, a Windows® 2000 driver is available for NetWare 5.1). If you are using NDPS version 1 with NetWare 4.x, only 3.1x and 95/98/Me options will be available. NDPS version 2 for NetWare 4.x will support NT drivers automatic download.
6. A complete list of currently loaded resources of that type appears in the Current Resources window. Click the Add button.
7. The Add <resource type> dialog appears. The listed resources that appear on this screen are currently installed.
8. Press the Browse button to locate the driver you want to add to the list. The driver list appears possibly showing several printers. This should be the driver in the different languages.
Creating a Printer Agent

Follow the steps below to create a Printer Agent for the control access printer (NDS object).

1. In NetWare Administrator, select `object | create | NDPS Printer`. Enter the NDPS printer name.

2. If this is a new printer select `create A New Printer Agent`.

3. If there is already an NDS printer and you are upgrading it to use the NDPS scheme, select `Existing NDS printer object`. You will then have to select which printer object you wish to upgrade.

4. Enter the name you wish the Printer Agent to be referred to by, and either type the name of the NDPS Manager or click the reference button and select a NDPS Manager. Select `Novell Printer Gateway` for the `Gateway type` and click `OK`.

5. Select `None` for the printer `Type`, and `Novell Port Handler` for the `Port Handler Type`. Then click `OK`.

6. You must now specify the type of connection that you are going to use. There are four possible options. Select the `LPR over IP` option.

7. Enter the relevant details of the printer, and Imagistics recommends typing `Binary_P1` for the printer name. Click `finish` and wait. Select the printer drivers for the client operating systems.

Follow the steps below to create a Printer Agent for the public access printer.

1. In NetWare Administrator, double click `NDPS Manager`.

2. Click `Printer Agent List`.

3. Click `New`.

4. Enter the name you wish the Printer Agent to be referred to by, and select `Novell Printer Gateway` for the `Gateway type` and click `OK`.
5 Select **None** for the printer Type, and **Novell Port Handler** for the Port Handler Type. Then click **OK**.

6 You must now specify the type of connection that you are going to use. There are four possible options. Select the **LPR over IP** option.

7 Enter the relevant details of the printer and Imagistics recommends typing *Binary_P1* for the printer name. Click **finish** and wait. Select the printer drivers for the client operating systems.

You are now ready to print.

### Configuring NetWare 3 and NetWare 4 systems

Imagistics BRAdmin Professional utility provides similar functionality to the NetWare PCONSOLE utility (or the NWADMIN utility in NetWare 4.1x or later). To use the BRAdmin Professional utility to create a Print server under NetWare, make sure that you are logged in as SUPERVISOR (NetWare 2.xx or 3.xx) or ADMIN (NetWare 4.1x or later) and perform the appropriate steps as detailed in the following pages.

You must install the Novell NetWare Client 32 if you wish to create queue information on your NetWare servers by BRAdmin Professional utility.

### Creating a NetWare Print Server (Bindery Queue Server) using BRAdmin Professional utility

1 Make sure that you logged in as SUPERVISOR (NetWare 2.xx or 3.xx) or ADMIN (NetWare 4.xx or later).

2 Start BRAdmin Professional utility.
3 One or more Print/Fax servers will appear in the list (the default node names are BRN_xxxxxx, where xxxxxx is the last six digits of the Ethernet address (MAC address)).

You can find the node name and MAC address by printing out the network configuration page. Refer to “Resetting the Print/Fax Server back to factory settings (Test Switch)” on page 14-4 for information how to print the configuration page.

4 Select the Print/Fax server that you wish to configure and double click it. You will be asked for a password. The default password is access.

5 Select the NetWare tab.

If necessary change the NetWare Print Server Name. The default NetWare Print server name will usually be BRN_xxxxxx_P1 where xxxxxx is the Ethernet address of the Print/Fax server. Be careful! Changing the name may impact the configuration of other protocols because the print server service names will be altered.

a If it is not already selected, select Queue Server as the operating mode.

b Click the Change Bindery Queues button.

c Select the NetWare server which you wish to configure.

d Select the New Queue button and type in the queue name which you wish to create.

e Once you have done that highlight the queue name you created and click on the Add button.

f Click on Close and then OK.

Now exit the BRAdmin Professional utility. You are ready to print.
Creating a NetWare Print Server (NDS Queue Server) using BRAdmin Professional utility

1 Make sure that you logged in as **ADMIN** in NDS mode.

2 Start BRAdmin Professional utility.

3 One or more Print/Fax servers will appear in the list (the default node names are **BRN_xxxxxx**, where **xxxxxx** is the last six digits of the Ethernet address (MAC address)).

   You can find the node name and MAC address by printing out the network configuration page. Refer to “Resetting the Print/Fax Server back to factory settings (Test Switch)” on page 14-4 how to print the configuration page.

4 Select the printer that you wish to configure and double click it. You will be asked for a password. The default password is **access**.

5 Select the **NetWare** tab.

   a If it is not already selected, select **Queue Server** as the operating mode.

   b Select the correct NDS tree and NDS context (you can manually enter this information, or by clicking on the down arrow by the side of NDS tree and the **Change** button by the side of NDS Context, you can let BRAdmin Professional utility display your choices automatically). Once you have specified this information, click on the **Change NDS queues** button.

   c In the **NetWare Print Queues** screen select the appropriate TREE and Context and then click the **New Queue** button.

   d Enter the queue name and specify the volume name. If you do not know the volume name, select the **Browse** button to browse the NetWare volumes. When the information is entered correctly, select the **OK** button.
Your queue name will appear in the TREE and Context that you specified. Select the queue and click on Add. The queue name will then be transferred to the Service Print Queues Window. You will be able to see the TREE and Context information along with the queue name information in this Window.

Click on the Close button. Your Imagistics Print/Fax server will now log into the appropriate NetWare server.

Now exit the BRAdmin Professional utility. You are ready to print.

**Creating a NetWare Print Server (NDS Queue Server) using Novell NWADMIN and BRAdmin Professional utility**

If you do not wish to use the Imagistics BRAdmin Professional utility application solely to configure your NetWare file server, use the following instructions for configuration using the NWADMIN application in conjunction with the BRAdmin Professional utility.

1. Make sure that you are logged in as ADMIN in NDS mode on the NetWare 4.1x (or later) file server and start the NWADMIN application.

2. Select desired Context that will contain the Printer and then click on Object from the menu bar and then Create. When you get the New Object menu, select Printer and then OK.

3. Enter the name of the printer and select Create.

4. Select the desired Context that will contain the default print queue, and then click on Object and Create to get the New Object menu.

5. Select Print Queue and then OK. Make sure that Directory Service Queue is selected and then type in a name for the default print queue.

6. Click on the button to select the print queue volume. Change the directory context if necessary, then select the desired volume (from Available Objects) and click OK. Click Create to create the print queue.
7 Change context if required and then double click the name of the printer you created in step 3.

8 Click **Assignments**.

9 Click **Add**.

10 Change the context if necessary.

11 Select the print queue you created in step 5.

12 Click **Configuration** and set the **Printer type** to **Other/Unknown**. Click **OK**.

13 Change the context if required, select **Object** from the menu bar and then **Create**. When you get the **New Object** menu, select **Print server** and then **OK**.

14 Enter the name of the Print server and select **Create**.

Enter the NetWare Print server name of the Print/Fax server exactly as it appeared in the NetWare tab of the BRAdmin Professional utility (this will generally be the **BRN_xxxxxx_P1** default service name, unless you changed the name).

You can find the current service name and MAC address by printing out the network configuration page. Refer to “Resetting the Print/Fax Server back to factory settings (Test Switch)” on page 14-4 how to print the configuration page.

**Important:**
Do not assign a password to the Print server or it will not log in.

15 Double click on the name of your Print server. Click on **Assignments** and then **Add**...

16 If necessary, change the directory context. Select the printer you created in step 3 and click **OK** and then **OK** again.

17 Exit NWADMIN.
18 Start the appropriate BRAdmin Professional utility, and select the correct Printer/Fax server from the list (by default, the node name is BRN_xxxxxx, where xxxxxx is the last six digits of the Ethernet address (MAC address)).

19 Double click the appropriate Imagistics Print/Fax server. You will be prompted for a password, the default password is access. Now select the NetWare tab.

20 Select **Queue Server** as the operating mode.

The same service assigned by NetWare server name cannot be used for both queue server mode and remote printer mode.

If you want to enable queue server capabilities on services other than the default NetWare services, you must define new services that are enabled for NetWare and for the desired port. Refer to the *Appendix* in this manual for information on how to do this.

21 Enter the NDS tree name (note that a Print/Fax server can service both NDS and bindery queues).

22 Type in the name of the context where the Print server resides.

23 Exit the BRAdmin Professional utility making sure that you save the changes that you have made. You are now ready to print.
Creating a NetWare Print Server (NDS Remote Printer) using Novell NWAdmin and BRAdmin Professional utility

To configure an Imagistics Print/Fax server for remote printer mode with NWADMIN (NetWare Administrator utility) and BRAdmin Professional utility, you will need to perform the following steps:

1. Make sure that the PSERVER NLM (NetWare Loadable Module) is loaded on your file server and that you are logged in as ADMIN in NDS mode on the NetWare 4.1x file server.

2. Start NWADMIN by double clicking on the icon. Select the desired Context that will contain the new printer.

3. Select Object from the menu bar and then Create. When you get the New Object menu, select Printer and then OK.

4. Enter the name of the printer and select Create.

5. Double click on the Print server name of your PSERVER NLM. Click on Assignments and then Add.

6. If necessary, change the directory context. Select the printer you created and click OK. Note the number of the printer, as you will use this later, then click OK.

7. Select the desired Context that will contain the default print queue, and then click on Object and Create to get New Object menu.

8. Select Print Queue and then OK. Make sure that Directory Service Queue is selected, and then type in a name for the default print queue.

9. Click on the button to select the print queue volume. Change the directory context if necessary, then select the desired volume (Objects) and click OK. Click Create to create the print queue.

10. Change context if required and then double click the name of the printer you created previously.

11. Click Assignments and then Add.
12 Change context if necessary and select the print queue you created. Click OK and then OK again, and then exit NWADMIN.

13 Start the appropriate BRAdmin Professional utility, and select the correct Print/Fax server you wish to configure (by default, the node name is BRN_xxxxxx, where xxxxxx is the latest six digits of the Ethernet address (MAC address)).

You can find the node name and MAC address by printing out the network configuration page. Refer to “Resetting the Print/Fax Server back to factory settings (Test Switch)” on page 14-4 for the information on how to print the configuration pager.

14 Double click the appropriate Print/Fax server. You will be prompted for a password, the default password is access.

15 Now select the NetWare tab.

16 Select Remote Printer as the Operating Mode, select the name of your PSERVER NLM as the Print server Name and select the number of the printer from step 6 as the Printer Number.

The same service assigned by NetWare Print server cannot be used for both queue server mode and remote printer mode. If you want to enable remote printer capabilities on a service other than the default NetWare service, you must define new services that are enabled for NetWare and for the desired port.

17 Click OK. And exit BRAdmin Professional utility.

You must now unload the PSERVER NLM from your NetWare file server console and then reload it in order for the changes to take effect.

Other Sources of Information

Refer to chapter 11 of this user guide to learn how to configure the IP address of the machine.
Printing From a Macintosh®

Printing From a Macintosh® Using AppleTalk and TCP/IP or Rendezvous

Overview

Imagistics print servers support the AppleTalk protocol running over Ethernet (also known as EtherTalk). This allows Macintosh users to print at the same time as all other Ethernet network using the AppleTalk (also referred to as EtherTalk) protocol.

With the release of System 8.6 or later, Apple introduced a TCP/IP printing capability. This allows Macintosh users to send print jobs using the TCP/IP protocol.

With the release of OS/X 10.2, Apple introduced support for Rendezvous printing. Rendezvous supports automatic network configuration. If you choose to use the Rendezvous features of your Imagistics product, you usually do not need to configure any IP address settings yourself.
Quick Tips:

1 The default name that will appear in the Chooser of a Macintosh will usually be BRN_xxxxxx_P1_AT (where xxxxxx is the last 6 digits of the Ethernet address)

2 From a Macintosh network, the easiest way to change this name is to assign an IP address to the printer and then use a Web browser to change the name. Connect to the machine using a web browser and then click on Network Configuration. Enter the password (the default password is access) then select Configure AppleTalk. Click on BRN_xxxxxx_P1_AT, then on Service Name. Enter the new name that you wish to appear in Chooser. Then click on Submit.

3 System 8.6 or later supports TCP/IP printing.

4 The default password for Imagistics print servers is access.

5 To print a printer settings page, see chapter 23 of the User’s Guide.

6 The Automatic Private IP Addressing (APIPA) protocol automatically assigns an IP address from the range: 169.254.1.0 to 169.254.254.255. If you want to disable the APIPA protocol, set APIPA to Off using control panel. For more information see page 10-9. If the APIPA protocol is disabled, the default IP address of a Imagistics Print/Fax server is 192.0.0.192. To change it, use the control panel, the BRAdmin Professional utility or let your DHCP server allocate an IP address to the printer.
Macintosh Configuration (OS 8.6 - 9.2)

Your Imagistics Printer is compatible with the standard Apple LaserWriter 8 printer driver (earlier versions of the LaserWriter drivers may crash or cause PostScript errors on large networks). If you do not have the LaserWriter 8 driver you must install it. Consult your Macintosh documentation for instructions on how to do this.

Before you try to use the Imagistics print server, you must first enable the EtherTalk protocol from the **Network Control Panel** on the Macintosh. If the EtherTalk protocol is not selected, or the **Network Control Panel** does not exist, you must use Apple's **Network Installer** software to add these capabilities.

The appropriate PPD file supplied with your machine must first be installed. Insert the CD-ROM into the CD-ROM drive of your computer. Select the **Start Here** icon, select your language and follow the on-screen instructions for **Install Software**.

![Figure 1 Typical Macintosh Installer](image)
How to Select the Print Server
(AppleTalk/EtherTalk)

Once the Print/Fax server is connected on your network and the machine is powered on, the Imagistics print server’s AppleTalk service name (default is `BRN_xxxxxx_P1_AT`, where `xxxxxx` is the last six digits of the Ethernet address (MAC address) should appear in the Chooser.

You can find the service name and MAC address by printing out the network configuration page. Refer to “Resetting the Print/Fax Server back to factory settings (Test Switch)” on page 14-4 how to print the configuration page.

1. Open the Chooser from the Apple Menu on the Macintosh, and then click on the LaserWriter icon (if necessary, select the appropriate AppleTalk zone from the Network Control Panel).

![Figure 2 Macintosh Chooser](image)

Figure 2 Macintosh Chooser
2 Click on the appropriate Print/Fax server and close the **Chooser** program. You should now be able to print from the Macintosh.

If you cannot see the Print/Fax server, first make sure that your cabling is correct and that you have enabled EtherTalk from your Macintosh **Network Control Panel**. You may also need to force the print server into the correct AppleTalk zone using the BRAdmin Professional utility or a web browser.

**How to Select the Print Server (TCP/IP)**

Apple has developed the **“Desktop Printer”** utility. This can be found from the **Apple menu** (this is only available from System 8.6 or later). When you run it you will see the following screen:

![New Desktop Printer](image)

**Figure 3 Selecting LPR Printing**
1 Select the **Printer (LPR)** option and click **OK**. You will then see the following:

![Image of Printer Configuration](image)

**Figure 4 Selecting the PPD and LPR Configuration**

2 At this point we must select the correct PPD file for the machine and also configure the correct LPR information. Click the **Change** button in the **PostScript Printer Description (PPD) File** section and select the appropriate PPD file for your model.

3 Now select the **Change** button below the **LPR Printer Selection** text.

4 You must then enter the IP address and service name details of the machine. When specifying the **Queue**, use the value `brn xxxxxxxx p1 at where xxxxxxx` are the last 6 digits of the Ethernet address.
Figure 5 Entering the IP address and Queue

If you do not specify the correct value the machine may not print, or it may not print the data correctly. Please ensure that the value you enter here matches with the Service name of the machine.

5 Click OK to go back to the previous screen.

6 You are now ready to create the printer for use. To do that, click the Create button and you will see the following:

Figure 6 Saving the printer to the Desktop

7 Enter the name of the printer in the Save desktop printer As: option and click on Save.

8 We must now make this our default printer by clicking the printer name once and then select Printing and Set Default Printer.

Whenever you send a print job, the printer that you just created will be used.
Macintosh Configuration
(OS X 10.1-10.2.1 or greater)

The appropriate PPD file supplied with your printer must be installed. Insert the CD-ROM into the CD-ROM drive of your computer. Select the Start Here OSX and follow the on-screen instructions.

How to Select the Print Server
(AppleTalk/EtherTalk)

After installing the PPD, use the following steps to select the printer driver:

1. Turn the power of the printer ON.
2. Open the Applications folder.
3. Open the Utilities folder.
4. Open the Print Center Icon.
5. Click the Add Printer button.
7. Select BRN_XXXXXX_P1_AT and click the Add button.

For AppleTalk connections, the machine's AppleTalk service name is BRN_XXXXXX_P1_AT, where XXXXXX is the last six digits of the Ethernet address.
Printing the configuration page will allow you to confirm the MAC address. Please refer to “Resetting the Print/Fax Server back to factory settings (Test Switch)” on page 14-4 how to print the network configuration page.

8 From the **Printer Model** pull-down list select your model.

9 Click **Add** and the printer will be available from the **Printer List**.

**How to Select the Print Server (TCP/IP)**

After installing the PPD, use the following steps to select the printer driver:

1 Turn the power of the printer ON.

2 Open the **Applications** folder.

3 Open the **Utilities** folder.

4 Open the **Print Center** Icon.

5 Click the **Add Printer** button.

6 Select **LPR Printers using IP**.

7 Enter the TCP/IP address of the printer into the **LPR Printer’s Address** box.

Printing the configuration page will allow you to confirm the TCP/IP address. Please refer to “Resetting the Print/Fax Server back to factory settings (Test Switch)” on page 14-4 how to print the configuration page.

8 If you are not using the default **Queue** enter the Queue name you are using.

9 From the **Printer Model** pull-down list select your model.

10 Click **Add** and the printer will be available from the **Printer List**.
Changing the Configuration

From a Macintosh, the easiest way to change the machine or Print/Fax server parameters is to use a web browser.

Simply connect to the machine using the format: http://ip_address where ip_address is the address of the machine.

Other Sources of Information

1 Refer to chapter 11 of this user guide to learn how to configure the IP address of the printer.

2 Refer to chapter 9 for more information on web-based management.

Rendezvous Printing

Rendezvous lets you create an instant network of computers and smart devices just by connecting them to each other.

Rendezvous support allows a Rendezvous ready printer to automatically configure itself to work in a OS X Rendezvous system. You do not need to manually configure any IP address or network settings within the printer as the printer will automatically configure itself.

Please note Imagistics recommends that you use version OS X 10.2.4 or later.
1 Run the **Print Center** software and click the **Add**.

![Print Center software](image)

2 Select **Rendezvous** and any Rendezvous compatible machines will be displayed.

![Rendezvous](image)

3 Click the machine and then change the **Printer Model** to "Imagistics". The PPD files that are installed on your Macintosh
are displayed. Select the relevant PPD file.

4 The Rendezvous ready machine is displayed.

5 Click the machine and click the **Make Default** button to set the printer as the default printer. The machine is now ready to print.
DLC Printing

Printing from Windows® NT or Windows® 2000

Overview

DLC is a simple protocol that is included in Windows NT® and Windows® 2000 as standard. It can be used on other operating systems (such as Windows® 3.x) with the addition of vendor-supplied software that supports the Hewlett-Packard JetDirect card.

Quick Tips:

1. One way to print the details of all network settings is to print a configuration page. Refer to “Resetting the Print/Fax Server back to factory settings (Test Switch)” on page 14-4 how to print the configuration page.

Because DLC is a non-routable protocol, there cannot be a router between the print server and the sending computer.

Configuring DLC on Windows® NT/2000

To use DLC on Windows® NT/2000, you must first install the DLC protocol.

1. Log into Windows® NT with administrative privileges. Go to the NT Control Panel and double click on the Network icon. Windows® 2000 users select the properties of the Local Area Connection.

2. On Windows® NT 3.5x systems, select Add Software. On Windows® NT 4.0 systems, click on the Protocol tab, and click Add. Windows® 2000 users click the Install button from the General tab.
3 Select **DLC Protocol** and then OK or **Add** if using Windows® 2000. You may be asked for the location of the files. For Intel based computers, the necessary files are stored in the i386 directory of the Windows® NT CD-ROM. If you have a non-Intel platform, specify the correct directory on your Windows® NT CD-ROM. Click **Continue** (for NT 3.5x systems) or **Close** (for NT 4.0 systems).

4 Reboot your system to make the change take effect. Windows® 2000 should not require a re-boot.

**Windows® 2000 Printer Setup**

1 Log into Windows® 2000 with administrative privileges. From the **Start** menu, select **Settings** and then **Printers**.

2 Select **Add Printer** (If you have already installed a Imagistics printer driver, double click the printer driver that you wish to configure and then select **Printers/Properties**, select the **Ports** tab, click on **Add Port** and continue from Step 6 (ignoring steps 11-14 about installing the correct driver)).

3 Click **Next**.

4 Select **Local Printer** and make sure that **Automatically detect and install my Plug and Play printer** is not checked.

5 Click **Next**.

6 Select the **Create a new port:** option and highlight **Hewlett-Packard Network Port**.

7 Click **Next**.

8 A list of available Print/Fax server MAC addresses (Ethernet addresses) appears in the larger box under **Card Address**. Select the address of the desired Print/Fax server (you can see
the Ethernet address on the network configuration page).

You can find the node name and MAC address by printing out the network configuration page. Refer to “Resetting the Print/Fax Server back to factory settings (Test Switch)” on page 14-4 how to print the configuration page on your Print/Fax server.

9 The selected print server address will then appear in the smaller box under Card Address.

10 Type in any desired name for the port (the name must not be the name of an existing port or DOS device, such as LPT1) and click OK then on the Printer Ports screen, click Next.

11 Select the correct driver click Next.

12 Give a name to the printer and specify if you wish to be able to print from DOS application. Then click Next.

13 Specify the share name (if you are going to share the printer).

14 Enter the Location and Comment information and click Next until you see the Completing the Add Printer Wizard screen.

15 Click Finish.

Windows® NT 4.0 Printer Setup

Log into Windows® NT with administrative privileges. From the Start menu, select Settings and then Printers.

1 Select Add Printer (If you have already installed a Imagistics printer driver, double click the printer driver that you wish to configure and then select Printers/Properties, select the Ports tab and continue from Step 4 (ignoring steps 9-11 about installing the correct driver)).

2 Select My Computer and then click Next.

3 Select Add a Port.
4 Select **Hewlett-Packard Network Port** and then click **New Port**.

5 A list of available Print/Fax server MAC addresses (Ethernet addresses) appears in the larger box under **Card Address**. Select the address of the desired Print/Fax server (you can see the Ethernet address on the network configuration page).

You can find the node name and MAC address by printing out the network configuration page. Refer to “Resetting the Print/Fax Server back to factory settings (Test Switch)” on page 14-4 how to print the configuration page on your print server.

6 The selected Print/Fax server address will then appear in the smaller box under **Card Address**.

7 Type in any desired name for the port (the name must not be the name of an existing port or DOS device, such as LPT1) and click **OK** then on the **Printer Ports** screen, click **Close**.

8 The name you selected in the above step will appear as a checked port in the list of available ports. Click **Next**.

9 Select the correct driver. Click **Next**.

10 Give a name to the printer. If desired, select the printer as the default.

11 Select **Shared** or **Not Shared**. If shared, specify the share name and the operating systems that will be printing to it.

12 Select whether or not you want to print a test page, and then select **Finish**.

**Windows® NT 3.5x Setup**

1 From the Windows® NT **Main** group, double click on the **Print Manager** icon.

2 Select **Printer** from the menu bar and click on **Create Printer**.

3 Enter any desired name for the printer in the **Printer Name** box.

4 Select the printer model in the **Driver** menu.
5 Choose **Other** (or **Network Printer** for V3.1 systems) from the **Print to** menu.

6 Click on **Hewlett-Packard Network Port**.

7 Type in your desired name for the port (this name must not be an existing port or DOS device, such as LPT1).

8 The MAC addresses (Ethernet addresses) of available Print/Fax servers will appear in the **Card Address** menu. Select the desired address (You can see the Ethernet address on the network configuration page).

9 Click **OK**.

10 If you want to share the printer, click **Share the Printer on the Network**.

11 Click **OK**.

12 If necessary, select the appropriate printer options and then click **OK**.

### Configuring DLC on Other Systems

To use DLC on other network systems, you will generally need vendor-supplied software. Typically such software will support the Imagistics Print/Fax servers. Follow the vendor's instructions to install the DLC protocol on your system.

Once the protocol is installed, create a network port in the same way that you did for Windows® NT in the previous sections. The MAC address (Ethernet address) of the Print/Fax server should automatically appear during the configuration process.
The final step is to create a printer using the normal operating system printer setup method. The only difference is that instead of connecting the printer to the LPT1 parallel port, you point it to the network port you just created.

⚠️ Imagistics does not recommend using the DLC protocol with Windows® for Workgroups 3.11 in a peer-to-peer configuration if the printer will be heavily used. This is because jobs may be rejected due to print spooler timeouts. The best solution in these situations is to set up one PC as a server for handling network print jobs. All of the other PCs send their print jobs to the server PC using NetBEUI or TCP/IP, and the server PC then uses DLC to send the print jobs to the Imagistics print server.
Web Based Management

How to use a Web Browser to manage your Device

Overview

A standard Web Browser (we recommend Netscape Navigator version 4.0 or later/Microsoft Internet Explorer version 5.0 or later) can be used to manage your machine using the HTTP (Hyper Text Transfer Protocol). You can get the following information from a printer on your network using a web browser:

1 Printer status information.

2 Change Fax configuration items, such as Initial Setup. One Touch Dial settings and Remote Fax.

3 You can also change network settings such as TCP/IP information, Internet Fax address information, etc.

4 Software version information of the machine and print server.

5 Change network and machine configuration details.

You must use the TCP/IP protocol on your network and have a valid IP address programmed into the Print/Fax server and your computer.

Quick Tips:

1 The Automatic Private IP Addressing (APIPA) protocol automatically assigns an IP address from the range: 169.254.1.0 to 169.254.254.255. If you want to disable the APIPA protocol, set APIPA to Off using control panel. For more information see page 10-9. If the APIPA protocol is disabled, the default IP address of a Imagistics print server is 192.0.0.192. To change it, use the control panel, the BRAdmin Professional or let your DHCP server allocate an IP address to the printer.

2 Refer to chapter 11 of this user guide to learn how to configure
the IP address on your machine.

3 The default password for Imagistics print servers is access.

4 You can use a web browser on most computing platforms, for example, Macintosh and Unix users are also able to connect to the machine and manage it.

5 You can also use the BRAdmin Professional utility to manage the printer and its network configuration.

**How to connect to your machine using a Browser**

Type `http://printer’s IP Address /` into your browser (you can also use the NetBIOS name of the Print/Fax server, if you are in a Microsoft Windows domain/Workgroup environment). Enter the DNS name of the machine if connecting to a network that uses the DNS protocol.

**Password Information**

Web Based Management offers two levels of password access. Users are able to access to the General Setup, Fax settings, I-Fax Settings and Lists and Reports. The default user name for Users is `user` (case sensitive) and the default password is `access`.

Administrators are able to access all settings. The login name for the Administrator is `admin` (case sensitive) and the default password is `access`.

**Other Sources of Information**

Refer to *chapter 11* of this user guide to learn how to configure the IP address of the machine.
LAN Main Setup Menu

With the Network (LAN) Board (NC-9100h Print/Fax Server) installed, you can connect your machine into the network to use the Internet FAX, Network Scanner and Network Printer.

1 Install the Network (LAN) Board (See “Optional accessories” in the printed User’s Guide.)

2 Set up the machine for your Network using the control panel.

You can also set up using BRAdmin and so on. (See Chapter 11)

The LAN menu selections allow you to setup the Imagistics machine for your network and Internet Fax configuration. Press Menu then press the appropriate number for LAN, based on the selections displayed on your machine. After you have displayed the LAN Main Setup menu, there are seven main selections: Setup TCP/IP, Setup Internet, Setup Mail RX, Setup Mail TX, Setup Relay, Setup Misc and Scan to E-mail. Proceed to the menu selection you wish to configure.

Please note that once you have specified a valid IP address for the machine, it is also possible to configure many aspects of the machine using your favorite web browser. For added flexibility, the machine is supplied with the BRAdmin Professional Windows® software, which also can be used to configure many aspects of the Print/Fax Server.
Setup TCP/IP

This menu has nine sections: **Boot Method, IP Address, Subnet Mask, Gateway, Host Name, WINS Config, WINS Server, DNS Server and APIPA.**

**BOOT Method**

1. (For ix2700) Press **Menu, 6, 1, 1.**
   (For ix2701) Press **Menu, 4, 1, 1.**

2. Press ← or → to select **Auto, Static, RARP, BOOTP or DHCP.**

3. Press **Enter.**

4. Press **Stop.**

**Static mode**
In this mode the machine IP address must be manually assigned. Once entered the IP address is locked to the assigned address.

**Auto mode**
In this mode, the machine will scan the network for a DHCP server, if it can find one, and if the DHCP server is configured to allocate an IP address to the machine, then the IP address supplied by the DHCP server will used. If no DHCP server is available, then the machine will scan for a BOOTP server. If a BOOTP server is available, and it is configured correctly, the machine will take its IP address from the BOOTP server. After it is initially powered ON, it may take a few minutes for the machine to scan the network for a server.

The machine supports “POWER SAVE mode” and if you are using the AUTO Boot mode, POWER SAVE must be set to OFF.

---

10 - 2 FRONT PANEL SETUP MENU
**RARP mode**

Imagistics Print / Fax server IP address can be configured using the Reverse ARP (RARP) facility on your host computer. This is done by editing the `/etc/ethers` file (if this file does not exist, you can create it) with an entry similar to the following:

```
00:80:77:31:01:07   BRN_310107
```

Where the first entry is the Ethernet address of the Print / Fax server and the second entry is the name of the Print / Fax server (the name must be the same as the one you put in the `/etc/hosts` file).

If the rarp daemon is not already running, start it (depending on the system the command can be `rarpd`, `rarpd -a`, `in.rarpd -a` or something else; type `man rarpd` or refer to your system documentation for additional information). To verify that the rarp daemon is running on a Berkeley UNIX-based system, type the following command:

```
ps -ax | grep -v grep | grep rarpd
```

For AT&T UNIX-based systems, type:

```
ps -ef | grep -v grep | grep rarpd
```

The Imagistics Print / Fax server will get the IP address from the rarp daemon when it is powered on.

**BOOTP mode**

BOOTP is an alternative to rarp that has the advantage of allowing configuration of the subnet mask and gateway. In order to use BOOTP to configure the IP address make sure that BOOTP is installed and running on your host computer (it should appear in the `/etc/services` file on your host as a real service; type `man bootpd` or refer to your system documentation for information). BOOTP is usually started up via the `/etc/inetd.conf` file, so you may need to enable it by removing the “#” in front of the `bootp` entry in that file. For example, a typical `bootp` entry in the `/etc/inetd.conf` file would be:

```
#bootp dgram udp wait /usr/etc/bootpd bootpd -i
```

Depending on the system, this entry might be called “bootps” instead of “bootp”.

---

FRONT PANEL SETUP MENU 10 - 3
In order to enable BOOTP, simply use an editor to delete the “#” (if there is no “#”, then BOOTP is already enabled). Then edit the BOOTP configuration file (usually /etc/bootptab) and enter the name, network type (1 for Ethernet), Ethernet address and the IP address, subnet mask and gateway of the Print / Fax server. Unfortunately, the exact format for doing this is not standardized, so you will need to refer to your system documentation to determine how to enter this information (many UNIX systems also have template examples in the bootptab file that you can use for reference). Some examples of typical /etc/bootptab entries include:

```
BRN_310107 1 00:80:77:31:01:07 192.189.207.3
```

and:

```
BRN_310107:ht=ethernet:ha=008077310107:
  ip=192.189.207.3:
```

Certain BOOTP host software implementations will not respond to BOOTP requests if you have not included a download filename in the configuration file; if this is the case, simply create a null file on the host and specify the name of this file and its path in the configuration file.

As with rarp, the Print / Fax server will load its IP address from the BOOTP server when the machine is powered on.

**DHCP mode**

Dynamic Host Configuration Protocol (DHCP) is one of several automated mechanisms for IP address allocation. If you have DHCP Server in your network (typically a Unix, Windows® NT®/2000/XP or Novell Netware network) the Print / Fax server will automatically obtains its IP address from DHCP server and register its name with any RFC 1001 and 1002-compliant dynamic name services.

If you do not want your Print / Fax server configured via DHCP, BOOTP or RARP, you must set the BOOT METHOD to static, this will prevent the Print / Fax server from trying to obtain an IP address from any of these systems. To change the BOOT METHOD, use the front panel, Web browser or by using the BRAdmin application.
IP Address

This field displays the current IP address of the machine. If you have selected a BOOT Method of STATIC, enter the IP address that you wish to assign to the machine (check with your network manager for the IP address to use). If you have selected a method other than STATIC, the machine will attempt to determine its IP address using the DHCP or BOOTP protocols. The default IP address of the Imagistics network board in your machine will probably be incompatible with the IP address numbering scheme of your network. We recommend that you contact your network manager for an IP address for the network the unit will be connected on.

1 (For ix2700) Press Menu, 6, 1, 2.
   (For ix2701) Press Menu, 4, 1, 2.

2 Select 1 to change. Enter the IP address.

3 Press Enter.

4 Press Stop.

When the BOOT METHOD is set to “AUTO”, the machine cannot receive IP address from a BOOTP server in Windows® 2000. So please ensure that you use DHCP for Windows® 2000 server.

Subnet Mask

This field displays the current subnet mask used by the machine. If you are not using DHCP or BOOTP to obtain the subnet mask, enter the desired subnet mask. Check with your network manager for the subnet mask to use.

1 (For ix2700) Press Menu, 6, 1, 3.
   (For ix2701) Press Menu, 4, 1, 3.

2 Enter the Subnet Mask address.

3 Press Enter.

4 Press Stop.
Gateway

This field displays the current gateway or router address used by the machine. If you are not using DHCP or BOOTP to obtain the gateway or router address, enter the address you wish to assign. If you do not have a gateway or router, leave this field blank. Check with your network manager if you are unsure.

1. (For ix2700) Press Menu, 6, 1, 4.
   (For ix2701) Press Menu, 4, 1, 4.

2. Select 1 to change. Enter the Gateway address.

3. Press Enter.

4. Press Stop.

Host Name

You can register the machine name on the Network. This name is often referred to as a NetBIOS name; it will be the name that is registered by the WINS server on your network. Imagistics recommends the name BRN_XXXXXX (where XXXXXX is the last six digits of the Ethernet address) (up to 15 characters).

1. (For ix2700) Press Menu, 6, 1, 5.
   (For ix2701) Press Menu, 4, 1, 5.

2. Enter the Host Name.

3. Press Enter.

4. Press Stop.
WINS CONFIG

This selection controls how the machine obtains the IP address for the WINS Server.

1 (For ix2700) Press Menu, 6, 1, 6. (For ix2701) Press Menu, 4, 1, 6.

2 Press ← or → to select Auto or Static.

3 Press Enter.

4 Press Stop.

Auto
Automatically uses a DHCP request to determine the IP addresses for the primary and secondary WINS servers. You must set the BOOT Method to Auto for this feature to work.

Static
Uses a specified IP address for the primary and secondary WINS servers.

WINS Server

1 (For ix2700) Press Menu, 6, 1, 7. (For ix2701) Press Menu, 4, 1, 7.

2 Press ← or → to select Primary or secondary.

3 Press Enter.

4 Enter the WINS Server address.

5 Press Enter.

6 Press Stop.

Primary WINS Server IP Address
This field specifies the IP address of the primary WINS (Windows® Internet Naming Service) server. If set to a non-zero value, the machine will contact this server to register its name with the Windows® Internet Name Service.
Secondary WINS Server IP Address
This field specifies the IP address of the secondary WINS server. It is used as a backup to the Primary WINS server address. If the Primary server is unavailable, the machine still can register itself with a secondary server. If set to a non-zero value, the machine will contact this server to register its name with the Windows® Internet Name Service. If you have a primary WINS server, but no secondary WINS server, simply leave this field blank.

DNS Server

1  (For ix2700) Press Menu, 6, 1, 8.
   (For ix2701) Press Menu, 4, 1, 8.

2  Press < or > to select Primary or secondary.

3  Press Enter.

4  Enter the DNS Server address.

5  Press Enter.

6  Press Stop.

Primary DNS Server IP Address
This field specifies the IP address of the primary DNS (Domain Name Service) server.

Secondary DNS Server IP Address
This field specifies the IP address of the secondary DNS server. It is used as a backup to the Primary DNS server address. If the Primary server is unavailable, the machine will contact the Secondary DNS server.
APIPA

The setting of On will cause the print server to automatically allocate a Link-Local IP address in the range (169.254.1.0 - 169.254.254.255) when the print/fax server cannot obtain an IP address through the BOOT Method you have set (Menu, 6, 1). Selecting Off means the IP address doesn’t change, when the print/fax server cannot obtain an IP address through the BOOT Method you have set.

1  (For ix2700) Press **Menu, 6, 1, 9.**
   (For ix2701) Press **Menu, 4, 1, 9.**

2  Press ® or ® to select **On** or **Off.**

3  Press **Enter.**

4  Press **Stop.**
Setup Internet (For ix2700 only)

This menu has five selections: Mail Address, SMTP Server, POP3 Server, Mailbox Name and Mailbox Pwd. You may find that it is more convenient to use your favorite web browser to configure these settings.

Mail Address

1 Press Menu, 6, 2, 1.

2 Select 1 to change. Enter the mail address. Press Enter.

3 Press Stop.

Entering text
You can access the character you want by pressing the appropriate number key repeatedly.

To change the mode between upper case and lower case for entering the E-mail / I-Fax address press Shift and 3.

Making corrections:
If you entered a letter incorrectly and want to change it, press ‒ to move the cursor under the incorrect character. Then press Clear/Back. The letter above the cursor will be deleted. Re-enter the correct character.
**Repeating letters:**
If you need to enter a character assigned to the same key as the previous character, press \( \rightarrow \) move the cursor to the right.

As you enter the E-mail address, it will appear character by character on the LCD panel.

If you specify more than 16 characters, the LCD panel will scroll the name to the left, character by character. You can enter up to 60 characters.

Please note that also you can connect to the machine using a web browser and specify the E-mail address information through Web Based Management.

**SMTP Server**

This field displays the Host Name or IP address of an SMTP mail server (outgoing E-mail Server) on your network.

(Ex, mailhost.imagisticsmail.net -or- 192.000.000.001)

1 Press **Menu, 6, 2, 2.**
2 Press \( \leftarrow \) or \( \rightarrow \) to select **Name or IP Address.**
3 Enter the SMTP SERVER Address.
4 Press **Enter.**
5 Press **Stop.**

**POP3 Server**

1 Press **Menu, 6, 2, 3.**
2 Press \( \leftarrow \) or \( \rightarrow \) to select **Name or IP Address.**
3 Enter the POP3 Server Address.
4 Press **Enter.**
5 Press **Stop.**
POP3 Server address
This field displays the Host Name or IP address of the POP3 server (incoming E-mail server) used by the Imagistics machine. This address is necessary for the Internet Fax features to function correctly.
(Ex, mailhost.imagisticsmail.net -or- 192.000.000.001)

Mailbox Name

1 Press Menu, 6, 2, 4.
2 Enter the user account name assigned to the Imagistics machine to login to the POP3 Server.
3 Press Enter.
4 Press Stop.

Mailbox Pwd

1 Press Menu, 6, 2, 5.
2 Enter the user password assigned to the MFC to login to the POP3 Server. Please note that this password is case sensitive.
3 Press Enter.
4 Press Enter again to verify the password.
5 Press Stop.

Setup Mail RX (For ix2700 only)

This menu has Five selections Auto Polling, Poll Frequency, Header, Del Error Mail and Notification.

Auto Polling

When set to On the machine automatically will check the POP3 server for new messages. “No Mail” will be displayed if there are no E-mail messages when the POP3 server is polled.

1 Press Menu, 6, 3, 1.
2 Press \( \leftarrow \) or \( \rightarrow \) to select On or Off.

3 Press Enter.

4 Press Stop.

**Poll Frequency**

Sets the interval for checking for new messages on the POP3 server (default is 10Min).

1 Press Menu, 6, 3, 2.

2 Enter the polling frequency.

3 Press Enter.

4 Press Stop.

**Header**

This selection allows the contents of the mail header to be printed when the received message is printed (Subject+From+To or All or None).

1 Press Menu, 6, 3, 3.

2 Press \( \leftarrow \) or \( \rightarrow \) to select All or Subject+From+To or None.

3 Press Enter.

4 Press Stop.

**Del Error Mail**

When set to On, the machine automatically deletes error mails that the machine can not receive from the POP server.

1 Press Menu, 6, 3, 4.

2 Press \( \leftarrow \) or \( \rightarrow \) to select On or Off.

3 Press Enter.
4 Press Stop.

**Notification**

Notification feature allows a receive notification message to be transmitted to the sending station to indicate successful reception of the I-Fax.

“On” send notification mail to all I-Fax machines only sends an E-mail to I-Fax that supports the “MDN” specification.

1 Press **Menu, 6, 3, 5**.

2 Press ← or → to select On or MDN or Off.

3 Press **Enter**.

4 Press **Stop**.

**Setup Mail TX (For ix2700 only)**

This menu has three selections **Sender Subject**, **Size Limit** and **Notification**.

**Sender Subject**

This field displays the subject that is attached to the Internet Fax data being sent from the Imagistics machine to a PC (default is “Internet Fax Job”).

1 Press **Menu, 6, 4, 1**.

2 Select **1** to change the Sender Subject—**OR**—2 to exit.

3 Enter the subject information.

4 Press **Enter**.

5 Press **Stop**.
Size Limit

Some E-mail servers do not allow you to send large E-mail documents. The machine may display Out of Memory when trying to send E-mail documents (the System Administrator will often place a limit on the maximum E-mail size). With this function enabled, the machine will display Out of Memory when trying to send E-mail documents over 1Mbyte in size. The document will not be sent and an error report will be printed. The document you are sending should be separated into smaller documents that will be accepted by the mail server. (Ex. A 42 page document of the ITU-T Test Chart#1 test chart is approximately 1Mbyte in size).

1  Press **Menu**, **6**, **4**, **2**.

2  Press or to select **On** or **Off**.

3  Press **Enter**.

4  Press **Stop**.

Notification

Notification feature when switched to **On** sends two fields of data in addition to the image data which requests a notification from the receiving station for successful reception. The receiving I-Fax station must support the MDN standard in order to be able to understand the request and consequently submit a notification message confirming successful receipt of the I-Fax.

1  Press **Menu**, **6**, **4**, **3**.

2  Press or to select **On** or **Off**.

3  Press **Enter**.

4  Press **Stop**.
Setup Relay (For ix2700 only)

This menu has three selections RLY Broadcast, Relay Domain and Relay Report. For details on Relay Broadcast refer to Chapter 9, How to use the Web-Based Management Utility or Chapter 12 Internet Fax.

RLY Broadcast

This function allows the machine to receive a document over the Internet, and then relay it to other fax machines through conventional analog landlines

1. Press Menu, 6, 5, 1.
2. Press ← or → to select On or Off.
3. Press Enter.
4. Press Stop.

Relay Domain

You can register the Domain Names (Max.10) that are allowed to request a Relay Broadcast.

1. Press Menu, 6, 5, 2.
2. Press ← or → to select the Relay Domain (01 - 10).
3. Press Enter.
4. Enter the Relay Domain name for the Domain that is being allowed to request a Relay Broadcast.
5. Press Enter.
6. Press Stop.
Relay Report

Relay Broadcast Report can be printed at the machine used as the Relay Station for all Relay Broadcasts. Also, when the machine is used with the Imagistics Network PC Fax software the machine is acting as a Relay Station for fax transmissions from the network so a Relay Report can also be printed for confirmation of sent network faxes. (For US / Canada only)

Its primary function is to print reports of Relay Broadcasts from external sources through the machine. Please note that this is not possible without the consent of the Relaying Station as permission in the form of Relay Domain has to be given to external parties.

1. Press Menu, 6, 5, 3.
2. Press or to select On or Off.
3. Press Enter.
4. Press Stop.

Setup Misc.

Netware

You can select to switch the NetWare feature “On”, this allows you specify the Frame Type is item 2.

1. (For ix2700) Press Menu, 6, 6, 1.  
(For ix2701) Press Menu, 4, 2, 1.
2. Press or to select On or Off.
3. Press Enter.
4. Press Stop.
Net Frame

1. (For ix2700) Press **Menu, 6, 6, 2.**
   (For ix2701) Press **Menu, 4, 2, 2.**

2. Press ← or → to select **Auto/8023/ENET/8022/SNAP.**

3. Press **Enter.**

4. Press **Stop.**

Auto sets the Frame type to automatic, the network card will detect the frame type being used by the NetWare server (Recommended).

- **8023** sets the Frame type to Ethernet 802.3
- **ENET** sets the Frame Type to Ethernet II
- **8022** sets the Frame type to Ethernet 802.2
- **SNAP** sets the Frame type to Ethernet SNAP

* NET Frame Setting is available when NetWare is **On.**

AppleTalk

AppleTalk protocol is used with Macintosh Networks. If you are using your machine on a Macintosh network please select to **On.**

1. (For ix2700) Press **Menu, 6, 6, 3.**
   (For ix2701) Press **Menu, 4, 2, 3.**

2. Press ← or → to select **On** or **Off.**

3. Press **Enter.**

4. Press **Stop.**

DLC/LLC

1. (For ix2700) Press **Menu, 6, 6, 4.**
   (For ix2701) Press **Menu, 4, 2, 4.**

2. Press ← or → to select **On** or **Off.**

3. Press **Enter.**

4. Press **Stop.**
Net BIOS/IP

The Print / Fax Server supports SMB (Server Message Block) over the TCP/IP protocol via the NetBIOS interface. This means that just like regular Windows® PC's the Imagistics machine can appear in your network neighborhood. The main advantage of NetBIOS printing is that you are able to print from legacy DOS applications that are running on PC's that are connected to Microsoft networks.

1  (For ix2700) Press Menu, 6, 6, 5.
   (For ix2701) Press Menu, 4, 2, 5.

2  Press < or > to select On or Off.

3  Press Enter.

4  Press Stop.

Ethernet

Ethernet link mode. Auto allows the print server to operate in 100BaseTX full or half duplex, or in 10BaseT half duplex mode by auto negotiation.

100BaseTX Full Duplex (100B-FD) or Half Duplex (100B-HD) and 10BaseT Full Duplex (10B-FD) or Half Duplex (10B-HD) fix the print server link mode. This change is valid after the print server has been reset.

If you incorrectly set this value, you may not be able to communicate with your Print/Fax server.

1  (For ix2700) Press Menu, 6, 6, 6.
   (For ix2701) Press Menu, 4, 2, 6.

2  Press < or > to select Auto/100B-FD/100B-HD/
   10B-FD/10B-HD.

3  Press Enter.

4  Press Stop.
Time Zone (For ix2700 only)

This field displays the time zone you can set for your country. The time is the difference between your location and Greenwich Mean Time. This time will be shown on documents received via the Internet. For example, the Time Zone for Eastern Time in the USA and Canada is GMT-05:00.

1. Press **Menu, 6, 6, 7**.
2. Press <- or -> to select the time.
3. Press **Enter** to accept the selection.
4. Press **Stop** to exit the configuration menu.

Windows® Time Zone Setting

You can determine the time difference for your location by using the Time Zone setting in Windows®.

1. Click on **Start**.
2. Select **Settings / Control Panel**.
3. Double click on **Date/Time**.
4. Select **Time Zone**.

Verify your time zone setting from the pull-down menu (this menu displays the time difference from GMT).

Machine Setting List

This feature prints a report listing all the current machine settings. The LAN menu settings will be printed on the second page of the report.

1. (For ix2700) Press **Menu, 5, 5**.
   (For ix2701) Press **Menu, 1, 8**.
2. Press **Start**.
3. Press **Stop**.
Setup Scan to E-mail (For ix2700 only)

Color File Type for Scan to E-mail

You can select the default file type for Scan to E-mail (E-mail server) function.

1  Press **Menu, 6, 7**.

2  Press ← or → to select **PDF** or **JPEG**.

3  Press **Enter**.

4  Press **Stop**.
Assigning TCP/IP formation

Overview

The TCP/IP protocol requires that each device on the network have its own unique IP address. Use the following information to learn about IP address configuration.

The Automatic Private IP Addressing (APIPA) protocol automatically assigns an IP address from the range: 169.254.1.0 to 169.254.254.255. If you want to disable the APIPA protocol, set APIPA to Off using control panel. For more information see page 10-9. If the APIPA protocol is disabled, the default IP address of an Imagistics Print/Fax server is 192.0.0.192. However, you can easily change this IP address number to match with the IP address details of your network. This can be done in any of the following ways:

- From your machine’s control panel settings.
- BRAdmin Professional utility (for Windows® 95/98/Me, Windows NT® 4.0 and Windows® 2000/XP, using the IPX/SPX or TCP/IP protocols).
- DHCP, APIPA, Reverse ARP (rarp) or BOOTP.
- The ARP command.
- HTTP (Web browser).
- Other SNMP based management utility.
These configuration methods are described in the following paragraphs.

The IP address you assign to the Print/Fax server must be on the same logical network as your host computers. If it is not, you must properly configure the subnet mask and the router (gateway).

Using the machine’s control panel to allocate an IP address (Models with LCD panels only)

Refer to Chapter 10 for details on how to configure IP address information using the machine’s control panel. By using the control panel on the machine, you can program the IP address details at the same time that other machine parameters are configured.

Changing the IP Address using the BRAdmin Professional utility

Please use BRAdmin Professional utility version on the CD-ROM that was supplied with your Imagistics product or later.

Start the BRAdmin Professional utility (from Windows® 95/98/Me, Windows NT® 4.0 and Windows® 2000/XP).
The BRAdmin Professional utility can use the IPX/SPX or TCP/IP protocols to communicate with the Imagistics Print/Fax server.

If you wish to use the TCP/IP protocol to manage the Print/Fax server make sure that the Print/Fax server has a valid IP address. If you are not using DHCP, BOOTP or RARP, you will want to change the IP address. There are two ways to change the IP address using the BRAdmin Professional utility:

- Use the IPX/SPX protocol.
- Use the TCP/IP protocol and let BRAdmin Professional utility find the Imagistics Print/Fax server as an unconfigured device.

**Using BRAdmin Professional utility and the IPX/SPX Protocol to set the IP address**

If your PC is using the Novell Netware Client software and is using the IPX/SPX protocol, do the following:

1. Select **IPX/SPX filter** in the left frame of the main window.

2. Check the Print/Fax server name (the default node name is `BRN_xxxxxx`, where `xxxxxx` is the last six digits of the Ethernet address (MAC address)).

   If you cannot find your server name, select the **Device** menu and choose **Search Active Devices** (you can also press the F4 key) and try again.

   You can find the node name and MAC address by printing out the network configuration page. Refer to “Resetting the Print/Fax Server back to factory settings (Test Switch)” on page 14-4 how to print the configuration page.

3. Select the Print/Fax server that you wish to configure and double click it. You will be asked for a password. The default password is `access`.

4. Select the **TCP/IP** tab and set the **IP address**, **Subnet mask** and **Gateway** as needed.
5 In the **IP Config** box, click the **Static** radio button.

6 Click **OK**.

Restart the print server by using BRAdmin Professional utility or Web Browser. If you are not sure how to restart the print server, you may simply turn the machine’s power switch off, and then switch it on.

**Using BRAdmin Professional utility and the TCP/IP Protocol to set the IP address**

If your PC is using the TCP/IP protocol, do the following:

1 Select **TCP/IP filter** in the left frame of the main window.

2 Select the **Device** menu and choose the **Search Active Devices**.

   ![Note]
   
   If the Print/Fax server is set to its factory default settings, it will not appear in the BRAdmin Professional utility screen. However, selecting the **Search Active Devices** option will force the BRAdmin Professional utility to find the device as an **unconfigured device**.

3 Select the **Devices** menu and choose **Setup Unconfigured Devices**.

4 Select the MAC address of your Print/Fax server and click the **Configure** button.

You can find the node name and MAC address by printing out the network configuration page. Refer to “Resetting the Print/Fax Server back to factory settings (Test Switch)” on page 14-4 how to print the configuration page.

5 Enter the **IP address**, **Subnet mask** and **Gateway** (if needed) of your Print/Fax server.

6 Click **OK** then select **Close**.

7 With the correctly programmed IP address, you will see the Imagistics Print/Fax server in the device list.
Using DHCP to Configure the IP address

The Dynamic Host Configuration Protocol (DHCP) is one of several automated mechanisms for IP address allocation. If you have DHCP Server in your network (typically a Unix/Linux, Windows NT® 4.0, Windows® 2000, XP or Novell Netware network) the Print/Fax server will automatically obtains its IP address from DHCP server and register its name with any RFC 1001 and 1002-compliant dynamic name services.

If you do not want your Print/Fax server configured via DHCP, BOOTP or RARP, you must set the BOOT METHOD to static so that the Print/Fax server has a static IP address. This will prevent the Print/Fax server from trying to obtain an IP address from any of these systems. To change the BOOT METHOD, use the machine’s control panel, a Web browser or by using the BRAdmin Professional utility.

Using APIPA to Configure the IP Address

With Automatic Private IP Addressing (APIPA), DHCP clients automatically configure an IP address and subnet mask when a DHCP server is not available. The device chooses its own IP address in the range 169.254.1.0 through to 169.254.254.255. The subnet mask is automatically set to 255.255.0.0 and the gateway address is set to 0.0.0.0.

By default, the APIPA protocol is enabled.
Using ARP to Configure the Print/Fax Server IP Address

If you are unable to use the BRAdmin Professional utility or the FAX\MFC’s control panel and your network does not use a DHCP server, you can also use the ARP command. The ARP command is available on Windows® systems that have TCP/IP installed as well as Unix systems. To use arp enter the following command at the command prompt:

```
arp -s ipaddress ethernetaddress
```

Where `ethernetaddress` is the Ethernet address (MAC address) of the Print/Fax server and `ipaddress` is the IP address of the Print/Fax server. For example:

**Windows® Systems**

Windows® Systems require the colon “-” character between each digit of the Ethernet address.

```
arp -s 192.189.207.2 00-80-77-31-01-07
```
Unix/Linux Systems

Typically, Unix systems require the hash “:” character between each digit of the Ethernet address.

```
arp -s 192.189.207.2 00:80:77:31:01:07
```

You must be on the same Ethernet segment (that is, there cannot be a router between the Print/Fax server and operating system) to use the arp -s command.

If there is a router, you may use BOOTP or other methods described in this chapter to enter the IP address.

If your Administrator has configured the system to deliver IP addresses using BOOTP, DHCP or RARP your Imagistics Print/Fax server can receive an IP address from any one of these IP address allocation systems. In which case, you will not need to use the ARP command. The ARP command only works once. For security reasons, once you have successfully configured the IP address of a Imagistics Print/Fax server using the ARP command, you cannot use the ARP command again to change the address. The Print/Fax server will ignore any attempts to do this. If you wish to change the IP address again, use a Web Browser, the machine’s control panel or factory reset the Print/Fax server (which will then allow you to use the ARP command again).

To configure the Print/Fax server and to verify the connection, enter the following command `ping ipaddress` where `ipaddress` is the IP address of the Print/Fax server. For example, `ping 192.189.207.2`. 
Using RARP to Configure the IP Address

The Imagistics Print/Fax server’s IP address can be configured using the Reverse ARP (rarp) facility on your host computer. This is done by editing the /etc/ethers file (if this file does not exist, you can create it) with an entry similar to the following:

00:80:77:31:01:07  BRN_310107

Where the first entry is the Ethernet address of the Print/Fax server and the second entry is the name of the Print/Fax server (the name must be the same as the one you put in the /etc/hosts file).

If the rarp daemon is not already running, start it (depending on the system the command can be rarpd, rarpd -a, in.rarpd -a or something else; type man rarpd or refer to your system documentation for additional information). To verify that the rarp daemon is running on a Berkeley UNIX-based system, type the following command:

    ps -ax | grep -v grep | grep rarpd

For AT&T UNIX-based systems, type:

    ps -ef | grep -v grep | grep rarpd

The Imagistics Print/Fax server will get the IP address from the rarp daemon when the printer is powered on.
Using BOOTP to Configure the IP Address

BOOTP is an alternative to rarp that has the advantage of allowing configuration of the subnet mask and gateway. In order to use BOOTP to configure the IP address make sure that BOOTP is installed and running on your host computer (it should appear in the /etc/services file on your host as a real service; type man bootpd or refer to your system documentation for information).BOOTP is usually started up via the /etc/inetd.conf file, so you may need to enable it by removing the “#” in front of the bootp entry in that file. For example, a typical bootp entry in the /etc/inetd.conf file would be:

```
#bootp dgram udp wait /usr/etc/bootpd bootpd -i
```

Depending on the system, this entry might be called “bootps” instead of “bootp”.

In order to enable BOOTP, simply use an editor to delete the “#” (if there is no “#”, then BOOTP is already enabled). Then edit the BOOTP configuration file (usually /etc/bootptab) and enter the name, network type (1 for Ethernet), Ethernet address and the IP address, subnet mask and gateway of the Print/Fax server. Unfortunately, the exact format for doing this is not standardized, so you will need to refer to your system documentation to determine how to enter this information (many UNIX systems also have template examples in the bootptab file that you can use for reference). Some examples of typical /etc/bootptab entries include:

```
BRN_310107 1 00:80:77:31:01:07 192.189.207.3
```

and:

```
BRN_310107:ht=ethernet:ha=008077310107:\
ip=192.189.207.3:
```
Certain BOOTP host software implementations will not respond to
BOOTP requests if you have not included a download filename in the
configuration file; if this is the case, simply create a null file on the host
and specify the name of this file and its path in the configuration file.

As with rarp, the Print/Fax server will load its IP address from the
BOOTP server when the machine is powered on.
Overview

Internet Faxing (I-FAX) allows you to send and receive FAX documents using the Internet as the transport mechanism. Documents are transmitted in E-mail messages as attached TIFF-F files. This means that PC's are also able to receive and send documents, providing that the PC has an application that can generate and view TIFF-F files. You can use Microsoft® Imaging. Any documents sent via the machine will automatically be converted into a TIFF-F format. If you wish to send and receive messages to and from your machine, your mail application on the PC must be able to support the MIME format.
Getting Connected

Before sending or receiving an Internet Fax you must configure your Imagistics machine to communicate with your network and mail server. You must ensure the following: a correctly configured IP address for your machine, an E-mail address for your machine, the mail server(s) IP address, mailbox name and password for your Imagistics machine. If you are unsure of any of these items, please contact your systems administrator. For details of how to configure this information, refer to the Web Based Management section (Internet Settings) of this User’s Guide.

Front Panel Key Functions

Shift + 1
Used to change input mode. You can use Dial Pad keys as Standard alphabet character keys.

Dial Pad
Used to enter Standard Alpha characters (26 letters), as well as @ . space ! # % & ' () + : ; < > = ? [ ] ^ - $ , *, _ and Numbers.

Shift + 3
To change between upper case and lower case for entering the e-mail / I-Fax address.

or
Moves the LCD cursor to the left or right when you enter the texts.

Set
Used to store multiple numbers.

Start
Begins transmitting the document.

Stop/Exit
Deletes entered data and stops the scanning or transmitting process.

One-touch / Speed-Dial / Group Dial
These functions work the same way as with conventional machine.
However, please note that you cannot use chain dialling for E-mail addresses.

Shift + Start
Used to receive E-mail from the POP3 server manually.

**Sending an Internet Fax**

Sending an Internet Fax is the same as sending a normal Fax. To manually enter the Internet Fax address please refer to page 12-3.

**Manually Entering Text.**

If you have already programmed the addresses of the Internet Fax receivers into the machine as Speed-Dial locations, you can send the Internet Fax by loading the document into the machine, use the Fax Resolution key to set the preferred resolution and select a Speed-Dial number and pressing Start.

This will differ depending on the whether your machine contains Speed-Dial keys or includes Navigator Keys.

If you wish to manually enter the Internet Fax Address load the document into the machine and press **Shift** and **1** simultaneously to change into the “alphabet” dialling mode.

Please refer to page 12-3 instructions on how to manually enter the Internet Fax address.

**Internet Fax specification does not support color resolutions and files types.**

**Manually Entering Text**

Press **Shift** and **1** simultaneously to change into the “alphabet” dialling mode.

You can now use the Dial Pad to dial the E-mail address. Refer to the following table: Most number keys have three or four letters printed above them. The keys for 0, #, * don’t have printed letters because they are used for special characters.
By pressing the appropriate number key the correct number of times, you can access the character you want.

<table>
<thead>
<tr>
<th>Key</th>
<th>Once</th>
<th>Twice</th>
<th>Three times</th>
<th>Four times</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>@</td>
<td>.</td>
<td>/</td>
<td>1</td>

<td>W</td>
<td>X</td>
<td>Y</td>
<td>Z</td>
</tr>
</tbody>
</table>

If you want to enter a blank space, press twice.

If you specify more than 16 characters, the LCD panel will scroll the name to the left character by character. You can enter up to 60 characters.

**Making corrections:**
If you entered a letter incorrectly and want to change it, press to move the cursor under the incorrect character. Then press Clear/Back. The letter above the cursor will be deleted. Re-enter the correct character.

**Repeating letters:**
If you need to enter a character assigned to the same key as the previous character, press to move the cursor to the right.

**Special characters and symbols**

Press * for (space) ! “ # $ % & ’ () * + , - . / €
Press # for : ; < = > ? @ [ ] ^ _
Press Ø for É À È Ê Î Ç Ë Ö 0 (For US and Canada users) Ä Ë Ö Ü À Ç È E 0 (For other users)

As you enter the Internet Fax address, it will appear character by character on the LCD panel.
If you specify more than 16 characters, the LCD panel will scroll the name to the left character by character. You can enter up to 60 characters.

1 Press **Start** to send the document.

After the document is scanned, it is transmitted to the Recipient Internet Fax Machine automatically via your SMTP server. You can cancel the send operation by pressing the **Stop/Exit** button during scanning. After the transmission is finished, the machine will return to standby mode.

Some E-mail servers do not allow you to send large E-mail documents (the System Administrator will often place a limit on the maximum E-mail size). You can enable the Limit Size of the Sent Mail feature. The machine will display **Out of Memory** when trying to send E-mail documents over 1Mbyte in size. The document will not be sent and an error report will be printed. The document you are sending should be separated into smaller documents that will be accepted by the mail server. You can turn on this feature through the Web Management utility or the LAN function mode.

**Receiving E-mail or Internet Fax**

There are 2 ways you can receive E-mail messages:

- POP3 receiving at regular intervals
- POP3 receiving (manually initiated)

Using POP3 receiving the machine must poll the E-mail server to receive the print jobs. This polling can occur at set intervals (for example, you can configure the machine to poll the E-mail server at 10 minute intervals) or you can manually poll the server by pressing the **Shift + Start** button.

If your machine starts to receive E-mail print jobs, the LCD panel will reflect this activity. For example, you will see **Receiving** on the LCD panel followed by “xx MAIL(S)”. If you press the **Shift + Start** buttons to manually poll the E-mail server for E-mail print jobs and there are no mail documents waiting to be printed, the machine will display **No Mail** on the LCD panel for two seconds.
If your machine is out of paper when receiving data, the received data will be held in the machine's memory. This data will be printed automatically after paper is re-inserted into the machine.

If the received mail is not in a plain text format or an attached file is not in the TIFF-F format, the following error message will be printed: “ATTACHED FILE FORMAT NOT SUPPORTED. FILE NAME:XXXXXXX.doc” If the received mail is too large, the following error message will be printed: “E-MAIL FILE TOO LARGE.” If “Delete POP Receive Error Mail” is “ON” (default) then error mail is automatically deleted from the E-mail Server.

Receiving an Internet Fax to a PC

When a PC receives an Internet Fax document, the document is attached to a mail message that informs the PC that it is receiving a document from an Internet Fax. This is notified in the Subject field of the received mail message.

If the PC to which you wish to send a document is not running Windows® 95/98/98SE/Me or Windows® NT4.0®/2000/XP operating system, please inform the PC's owner that software must be downloaded for documents in the TIFF-F format to be viewed.

You can use “Microsoft® Imaging” that is supplied with Windows® 95/98/Me or Windows® NT®4.0/2000/XP but some older versions of Windows® 95 do not support viewing TIFF-F documents.

Forwarding Received E-mail and Fax Messages

You can forward received E-mail or standard fax messages to another E-mail address or fax machine. Received messages can be forwarded via E-mail to a PC or Internet Fax. They can also be forwarded via standard phone lines to another machine.

This can be done using the Web Management Utility or through the front panel. The steps for configuring Fax Forward can be found in the User’s Guide supplied with your machine.
Relay Broadcasting

This function allows the Imagistics machine to receive a document over the Internet, and then relay it to other fax machines through conventional telephone lines.

If you wish to use your machine as a relay broadcast device, you must specify the domain name that you trust at the machine, in other words, the portion of the domain after the ‘@’ sign.

A trusted domain refers to the E-mail address. For example, if the other party’s address is bob@imagistics.com, then we identify the domain as imagistics.com. If the E-mail address is jack@imagistics.co.uk, then we identify the domain as imagistics.co.uk.

Use care in selecting a trusted domain since any user on a trusted domain will be able to send a Relay Broadcast. You can register up to 10 domain names.

Relay Broadcast can support the relay of a document up to a maximum of 48 fax machines through conventional telephone lines.

Relay Broadcast from a machine

FAX@imagistics.com    UKFAX@imagistics.co.uk    123456789
Your machine has an E-mail address of FAX@imagistics.com, you wish to send a document from this machine to another machine in England with an E-mail address of UKFAX@imagistics.co.uk, this machine will then forward the document to a standard fax machine using a conventional telephone line. If your E-mail address is FAX@imagistics.com, you must configure a trusted domain name of imagistics.com on the machine in England that will broadcast the document to the conventional fax machine. If you do not enter the domain name information, then the machine in the middle (the machine that will broadcast the document) will not trust any internet jobs that it receives from the machine in the @imagistics.com domain.

After the trusted domain is set you can send the document from your machine [I.E. FAX@imagistics.com] by entering the E-mail address of the machine [I.E. UKFAX@imagistics.co.uk] that will forward the document followed by the phone number of the fax that will receive the document. The following is an example of how to enter the E-mail address and phone number.

UKFAX@imagistics.co.uk(fax#1234567

E-mail address
Fax Phone Number

The word “fax#” must be included with the phone number inside the parenthesis.

**Sending to multiple phone numbers:**
If you want to have the document relayed to more than one standard fax machine the address can be entered using the following method:

1. Enter the phone number of the first Fax machine
   UKFAX@imagistics.co.uk(Fax#123).

2. Press the “Set” key.

3. Enter the phone number of the second Fax machine
   UKFAX@imagistics.co.uk(Fax#456).

4. Press **Start**.
Relay Broadcast from a PC

You can also send E-mail from your PC and have it relayed to a conventional FAX machine. The method of entering the phone number of the conventional FAX machine that will receive the relayed E-mail will vary depending on the mail application you are using. The following are some examples of different mail applications:

Some E-mail applications do not support sending to multiple phone numbers. If your E-mail application cannot support multiple phone numbers you will only be able to relay to one Fax machine at a time.

Enter the address of the relay machine and phone number of the FAX in the “TO” box using the same method used when sending from an machine.

UKFAX@imagistics.co.uk (fax#123456789)

Outlook 97/98/2000/XP:
For Outlook 97/98/2000 and XP the address information must be entered into the address book as follows:
Name: fax#123456789
E-mail Address: UKFAX@imagistics.co.uk

TX Verification Mail

Transmission Verification Mail supports two separate functions. Verification Mail for sending allows you request notification from the receiving station that the I-Fax or E-mail was received and processed. Verification Mail for receiving allows you to transmit a default report back to the sending station after successfully receiving and processing an I-Fax or E-mail.

12 - 9 INTERNET FAX (FOR IX2700 ONLY)
To use this feature you must set the “Notification” option within the “Setup Mail RX” and “Setup Mail TX” options.

**Setup Mail (TX)**

You can set the “Notification” option in the “Setup Mail TX” option to either ON or OFF. When switched to ON an additional field of information is sent with the image data. This field is named “MDN”.

**MDN**
Mail Disposition Notification - This field requests the status of the I-Fax / E-mail message after delivery through the SMTP (send mail transfer protocol) transport system. Once the message has arrived at the Receiving station this data is used when the machine or user reads or prints the received I-Fax or E-mail. For example, if the message is opened for reading or is printed the receiving station sends back a notification to the original sending machine or user.

The receiving station must support the MDN field in order to be able to send a notification report, otherwise the request will be ignored.

**Setup Mail (RX)**

There are three possible settings for this option ON/MDN/OFF.

**Receive Notification “ON”**
When switched to “ON” a fixed message is sent back to the sending station to indicate successful reception and processing of the message. These fixed messages depend on the operation requested by the sending station.

Report messages consist of

```
SUCCESS : Received From <mail address>
```

**Receive Notification “MDN”**
When switched to “MDN” a report as described above is sent back to the sending station if the originating station sent the “MDN” field to request confirmation.

**Receive Notification “OFF”**
OFF - Switches all forms of receive notification OFF, no messages are send back to the sending station regardless of the request.
Error mail

If there is a mail delivery error while sending an Internet Fax, the mail server will send an error message back to the machine and the error message will be printed. If there is an error while receiving mail, an error message will be printed (Example: “The message being sent to the machine was not in a TIFF-F format.”).

Important information on Internet Fax

Internet Fax Communication on a LAN system is basically the same as communication via E-mail; however, it is different from Fax communication using standard phone lines. The following is important information for using Internet Fax:

■ Factors such as the receiver’s location, structure of the LAN system, and how busy the circuit (such as the internet) is, may cause the system to take a long time to send back an error mail. (normally 20 sec to 30 sec).

■ In the case of transmission through the Internet, due to its low level of security, we recommend that you use standard phone lines to send confidential documents.

■ If the receiver’s mail system is not compatible with the MIME format, you cannot transmit a document to the receiver. Depending on receiver’s server, there may be some cases in which the error mail will not be sent back.

■ If the size of a document’s image data is huge, there is a possibility of unsuccessful transmission.

■ You cannot change font and character size of Internet mail that you received.
Overview

The Fax Server TX feature allows the ix2700 to scan hard copy documents and send them via a separate fax server. Unlike Internet Fax or I-Fax, the Fax Server TX feature utilizes a server to send the documents as fax data over phone or T-1 lines.

Setting the Fax Server TX to On

You can store prefix/suffix address in the machine and can send the documents over TCP/IP network to fax server.

1. Press Menu, 6, 8.
2. Press ← or → to select On and then press Enter.
3. Press ← or → to select Prefix and then press Enter.
4. Enter the prefix address using dial pad.
5. Press Enter.
6. Press ← or → to select Suffix and then press Enter.
7. Enter the suffix address using dial pad.
8. Press Enter.
9. Press Stop.

You can enter the prefix and suffix address within a total of 40 characters.
How to Operate

Whenever the Fax Server TX is set to On, you must use One-Touch dial or Speed Dial to send the fax message.

1 Place the document in the ADF or on the scanner glass.

2 Enter the fax number using One-Touch or Speed Dial number.

3 The machine will send the message over TCP/IP network to fax server.
Troubleshooting

Overview

This chapter describes procedures for troubleshooting problems you may encounter with an Imagistics Print/Fax server. It is divided into the following sections:

1 Installation Problems
2 Intermittent Problems
3 Protocol-Specific Troubleshooting
4 Internet FAX Troubleshooting

Installation problems

If you cannot print over the network, check the following:

1 Make sure that the machine is powered on, is on-line and ready to print.

Verify that the machine and the configuration are good by printing the network configuration page. Refer to the User’s Guide. If the test fails, check:

a If the LED is not blinking after connected to the network, then the network firmware settings may be corrupted. Please refer to Step 3.

b In this event, try to restore the factory default settings of the Print/Fax server. To learn how to restore the Print/Fax server, refer to “Resetting the Print/Fax Server back to factory settings (Test Switch)” on page 14-4. Once you have done that, switch the machine off and then on again, and try to print out the configuration page.
2 If the configuration page prints but you cannot print documents, try the following

If none of the following steps are successful, there is almost certainly a hardware or network problem!

a **If you are using TCP/IP:**
Try pinging the Print/Fax server from the host operating system command prompt with the command:

```
ping ipaddress
```

Where `ipaddress` is the print server IP address (note that in some instances it can take up to two minutes for the Print/Fax server to load its IP address after setting the IP address). If a successful response is received, then proceed to the UNIX, TCP/IP Windows® NT/LAN Server, Windows® 98/95/Me Peer to Peer (LPR), Internet Printing or Web Browser troubleshooting section. Otherwise, proceed to step 3, and then go to TCP/IP Troubleshooting section.

b **If you are using Novell system:**
Verify that the print server can be seen on the network. To do this, login as the SUPERVISOR (not as someone with supervisor privileges) or ADMIN (for Netware 4 or later servers), go into PCONSOLE or NWADMIN, select PRINT SERVER INFORMATION, and select the name of the print server (make sure that you have entered the Print/Fax server name). If you can see Print Server Status and Control in the menu, then the Imagistics Print/Fax server is visible to the network, proceed to the Novel NetWare Installation Troubleshooting Section. Otherwise, go to step 3.

c **If you are running AppleTalk for Macintosh:**
In case of using Postscript driver make sure that you can see the Print/Fax server name under the LaserWriter 8 icon in the Chooser. If it is visible, then the connection is good, so proceed to the AppleTalk for Macintosh Section. Otherwise, go to step 3.
3 If you cannot make any of the connections in step 2, check the following:

a Make sure the machine is powered on and on-line.

b Check the cabling, network connection, and print out a configuration page in the Network STATISTICS information to see if bytes are being transmitted and received.

c Check to see if there is any LED activity.

The Print/Fax server has two LEDs on the back panel of the machine. The upper side LED shows Link/Speed status. The lower side LED shows Activity (Receive/Transmit) status.

■ No light: If the both of two LEDs are off, then the Print/Fax server is not connected to the network.

■ Link/Speed LED is orange: Fast Ethernet
  The Link/Speed LED will be orange if the Print/Fax server is connected to a 100BaseTX Fast Ethernet network.

■ Link/Speed LED is green: 10BaseT Ethernet
  The Link/Speed LED will be green if the Print/Fax server is connected to a 10BaseT Ethernet network.

4 If you are using a repeater or hub, make sure that SQE (heartbeat) is turned off at the hub (if applicable). Also, if you have a hub or multi-port repeater, verify that the hub or repeater port is good by trying the Print/Fax server on a different port or on the other hub or multi-port repeater.

5 If you have a bridge or router located between the Print/Fax server and host computer, make sure that the device is set up to allow the Print/Fax server to send and receive data from the host. For example, a bridge can be set up to only allow certain types of Ethernet addresses to pass through (a process known as filtering); therefore, such a bridge must be configured to allow Imagistics Print/Fax server addresses. Likewise, a router can be set up to pass only certain protocols, so be sure that the desired protocol can be passed through to the Print/Fax server.
6 If the job exits the queue but does not print, make sure that you are not trying to print a text job to a PostScript printer. If you have a printer that is capable of automatic language switching, make sure that the printer is not forced into PostScript mode.

**Resetting the Print/Fax Server back to factory settings (Test Switch)**

- **Short push:**
  Prints a network configuration page.

- **Long push (more than 5 seconds):**
  Resets the network configuration back to factory default settings.

**Intermittent Problems**

If the Print/Fax server and printer start up OK, but you intermittently have problems printing, check the following:

1. If you can print small jobs but large graphics jobs are distorted or incomplete, make sure that you have adequate memory in your printer and the latest printer driver installed on your computer.

2. Check the individual protocol troubleshooting sections in this chapter for additional causes of intermittent printer problems.
TCP/IP Troubleshooting

If you are using TCP/IP and cannot print to the Print/Fax server and you have checked the hardware and network as described in the previous steps, then check the following:

It is always a good idea to try following in order to eliminate the possibility of setup errors.

Turning off the printer and then on again, Deleting and recreating the Print server and creating a new print queue in order to eliminate the possibility of setup errors.

1 The problem may be the result of mismatched or duplicate IP address. Verify that the IP address is correctly loaded into the Print/Fax server (via the configuration page. Make sure that no other nodes on the network have this address (DUPLICATE IP ADDRESS ARE THE BIGGEST CAUSE OF TCP/IP PRINTING PROBLEMS).

2 Make sure that the TCP/IP protocol of the print/Fax server is enabled.

3 If you used rarp, make sure that you started the rarp daemon on any workstation using the rarpd, rarpd-a, or equivalent command. Verify that the /etc/ethers file contains the correct Ethernet address and that the Print/Fax server name matches the name in the /etc/hosts file.

4 If you used bootp, make sure that you started the bootp daemon on any UNIX workstation and bootp is enabled (i.e., the “#” is removed from the bootp entry) in the /etc/bootptab file is correctly configured.

5 Also verify that host computer and the Print/Fax server are either on the same subnet, otherwise that the router is properly configured to pass data between the two devices.

UNIX Troubleshooting

1 Make sure that the /etc/printcap file (if applicable) is typed in correctly. In particular, look for missing “:” and “\” characters, because a small error anywhere in the file can have major consequences. Also check the /usr/spool directory to make sure that you have created a valid spool directory.
2 If you are using a Linux operating system, the X-Window Print tool program that is included with Linux may not properly configure the etc/printcap file for lpd operation, then you might also edit the etc/printcap file and change the following line in the entry for the printer.

```plaintext
if 
 :lp = /dev/null: \ 
then to 
 :lp = :\ 
```

3 If you are using a Berkeley-based UNIX, make sure that the daemon is started on Berkeley based systems with the command lpc start printer, where printer is the name of the local print queue.

4 If you are using an AT&T-based UNIX, make sure the printer is enabled (enable printer, where printer is the name of the local print queue).

5 Make sure that the lpr/lpd remote line printer service are running on the host computer (refer to your host computer documentation for information on how to do this).

6 If text or PCL jobs are run together, try setting the service (remote printer) with EOT set to string number 2 (\textit{<ESC>}E). For example:

```plaintext
SET SERVICE BRN_xxxxxx_P1 EOT 2
```

7 If PostScript jobs fail to print or are run together, try setting the service (remote printer) with EOT set to string number 3 (\textit{control-D}). For example:

```plaintext
SET SERVICE BRN_xxxxxx_P1 EOT 3
```

8 If the lines of a text file are staggered, make sure that you have specified a remote printer (rp) name of TEXT in your /etc/printcap file.
9 If you are using Sun Solaris V2.4 or earlier, there is a bug which causes long print jobs to fail when using a Printer/Fax server. If you are having trouble printing long jobs (over 1MB), add the line mx#0 to your etc/printcap file entry.

10 If you cannot print from DEC TCP/IP Service for VMS (UCX), make sure that you have version 2.0B or later of this software, because earlier versions will not work with Imagistics Print/Fax servers.

Windows® NT/LAN Server (TCP/IP) Troubleshooting

If you are having trouble printing with Windows® NT or LAN Server, check the following:

1 Make sure that TCP/IP and TCP/IP print service are installed and running on the Windows® NT system or the LAN Server file server.

2 If you are using DHCP and you have not created a reservation for the Print/Fax server, make sure that you enter the NetBIOS name of the Print/Fax server in the Name or address of server providing lpd box.

Windows® 95/98/Me Peer to Peer Print (LPR) Troubleshooting

If you are having trouble printing on a Windows® 95/98/Me Peer-to-Peer network (LPR method), check the following:

1 Make sure that the Imagistics LPR Port driver is correctly installed and configured according to the Windows® 95/98/Me Peer-to-Peer chapters.

2 Try to turn the Byte Count on in the Configure port area of printer driver properties.

You may find that during the installation of BLP software, the screen that prompts you for a Port name is not displayed. This may happen on some Windows® 95/98/Me computers. Press the ALT and TAB keys to make it appear.
If you are having trouble printing on a Windows® 95/98/Me Peer-to-Peer network, check the following (HP JetAdmin compatible method):

1. If the Print/Fax server does not show up under JetAdmin on a Windows® 95/98/Me Peer-to-Peer network, try removing all of the Windows® 95/98/Me network software from the Network Control panel and then reinstalling them as follows:
   - First install the IPX/SPX-Compatible Protocol (or the TCP/IP protocol if you are using a later version of JetAdmin), the Client for Microsoft Networks, and the network adapter card driver.
   - Install the Latest HP JetAdmin software.
   - Restart the system, and then add the HP JetAdmin service.

Windows® 95/98/Me/2000/XP/NT 4.0 Peer-to-Peer Print (NetBIOS) Troubleshooting

If you are having trouble printing on a Windows® 95/98/Me/2000/XP/NT 4.0 (or later) Peer-to-Peer network (NetBIOS), check the following:

1. Make sure that the Imagistics NetBIOS Port driver is securely installed and configured according to the Windows® 95/98/Me/2000/XP/NT 4.0 Peer-to-Peer (NetBIOS) chapters. You may find that during the installation of the port driver, the screen that prompts you for a Port name is not displayed. This happens on some Windows® 95/98/Me/2000/XP/NT 4.0 computers. Press the ALT and TAB keys to make it appear.

2. Make sure that the Print/Fax server is configured to be in the same workgroup or domain as the rest of your computers. It may take several minutes for the Print/Fax server to appear in the network neighborhood.
Imagistics Internet Print (TCP/IP) Troubleshooting

1 The first step in troubleshooting is to make sure that you have a valid E-mail connection on both the sending PC and the receiving Print/Fax server. Try sending an E-mail message from the PC to a user at the remote site who can receive mail via the POP3 server. If this does not work, there may be an E-mail configuration problem on the PC, on the local E-mail server, or on the remote POP3 server. Double check to make sure that the E-mail parameters that you configured on the PC and on the remote Print/Fax server match those that are configured on the E-mail servers.

2 If you can print small files OK but are having problems printing large files, the problem may be in the E-mail system! Some E-mail systems have difficulties printing large files. If the file does not reach its destination intact, then the problem is with the E-mail system.

3 You can also enable the partial E-mail print facility on your client PC, this will split the E-mail up into fragments which should then not overwhelm your E-mail server. To do this, select the property dialog of the Imagistics Internet Print Port.

Windows® 95/98/Me/2000/XP IPP Troubleshooting

Want to use a different Port number other than 631
If you are using Port 631 for IPP printing, you may find that your firewall may not let the print data through. If this is the case, use a different port number (port 80), or configure your Firewall to allow Port 631 data through.

To send a print job using IPP to a printer using Port 80 (the standard HTTP port) enter the following when configuring your Windows® 2000/XP system.

http://ip_address/ipp
"Get More Info" option in Windows® 2000 not working
"Go to Priner’s Web site" in Windows® XP not working
If you are using a URL of:

http://ip_address:631 or http://ip_address:631/ipp, the Get More Info option in Windows® 2000 or the Go to Printer’s Web site option in Windows® XP will not function. If you wish to use the Get More Info or the Go to Printer’s Web site option use the following URL:

http://ip_address

This will then force Windows® 2000/XP to use Port 80 to communicate with the Imagistics Print/Fax server.

Windows® 95/98/Me clients not able to get the driver from a Windows® 2000/XP system.

You must be using version 4.0 or later of Internet Explorer and the Microsoft Internet Print Services software must be installed on your client computers.

Novell NetWare Troubleshooting

If you cannot print from NetWare and you have checked the hardware and network as described in the previous steps, first verify that the Imagistics Print/Fax server is attached to the server queue by going to PCONSOLE, selecting PRINT QUEUE INFORMATION, and then CURRENTLY ATTACHED SERVERS. If the print server does not appear in the list of attached servers, then check the following:

It is always a good idea to try followings in order to eliminate the possibility of setup errors.

■ Turning off the machine and then on again to force to rescan the Netware queue.

■ Deleting and recreating the print server and creating a new print queue in order to eliminate the possibility of setup errors.
1. If you changed the login password, you must change the password in both the Imagistics Print/Fax server (using the `SET NETWARE PASSWORD` command if you are using the BRConfig software or by using a web browser or the BRAdmin Professional utility) and in the file server (using the PCONSOLE Print Server Information Change Password command).

2. If you created the print queue using PCONSOLE and BRConfig instead of BRAdmin Professional utility, make sure that you have enabled at least one NetWare file server using the `SET NETWARE SERVER servername ENABLED` command.

3. Have you exceeded your NetWare user limit?

4. Make sure that the print server name you used in PCONSOLE exactly matches the name that is configured in the Print/Fax server, and make sure it is defined as a Queue Server for the print queue.

5. If you are running both 802.3 and Ethernet II frames on different file servers on your network, there is a possibility that the Print/Fax server may not make a connection to the desired file server. Try forcing the frame type to the desired one using the `SET NETWARE FRAME` command from the Print/Fax server remote console or using BRAdmin Professional utility.

6. If you are using DOS CAPTURE statement and losing portions of your print job, try setting the TIMEOUT parameter in your CAPTURE statement to a higher value (at least 50 seconds for Windows®).

**AppleTalk Troubleshooting**

In case of using Postscript driver, if you cannot print from an AppleTalk for Macintosh computer and you have checked the hardware and network as described in the previous steps, then check the following:

1. Make sure that you are running Phase 2 AppleTalk and that you have selected the correct network interface from the AppleTalk Control Panel on the Macintosh.
2 Make sure that the AppleTalk protocol of the Print/Fax server is enabled.

3 If you have a large network, make sure that you have the Laser Writer V8.xx or equivalent driver, since earlier versions may cause PostScript errors. Also, verify that you get the correct printer information when you select Printer Info from the Setup button in the Chooser.

4 Make sure that you have selected the correct Printer Description File (PPD) from the Chooser (otherwise PostScript errors may result).

5 Verify that you have selected the correct AppleTalk zone. Because the Print/Fax server gets its zone information from router broadcasts, it may not be in the zone you expect, and will therefore not show up in the Chooser. If this is the case, you may need to force the zone name using BRAdmin Professional utility, a web browser.

**DLC/LLC Troubleshooting**

If you are having trouble printing with DLC/LLC, check the following:

1 Make sure that the DLC/LLC protocol is enabled using either BRAdmin Professional utility, a web browser or TELNET.

2 Make sure that the MAC address of the Windows® setting is the same as shown in the network configuration page printout.

**Web Browser Troubleshooting (TCP/IP)**

1 If you can not connect to the Print/Fax server using your web browser it may be worth checking the Proxy Settings of your browser. Look in the Exceptions setting and if necessary, type in the IP address of the Print/Fax server. This will stop your PC from trying to connect to your ISP or proxy server every time you wish to look at the Print/Fax server.

2 Make sure that you are using the proper Web Browser, we recommend Netscape Navigator version 4.0 or later/ Microsoft Internet Explorer version 4.0 or later.
Internet Fax Troubleshooting

1. If there is a mail delivery error while sending an Internet Fax, the mail server will send an error message back to the machine and the error message will be printed. If there is an error while receiving mail, an error message is printed (Ex. The message being sent to the machine was not in a TIFF-F format.) All documents transmitted to the machine via E-mail must be in a TIFF-F format.

2. If an error message is printed while receiving E-mail text from a PC “ATTACHED FILE FORMAT NOT SUPPORTED” the senders mail application may not be set for a “Plain Text” format or “Vcard” the virtual business card feature may be set to ON.

3. If the receiver's mail system is not compatible with the MIME format, you cannot transmit a document to the receiver. Depending on the receiver's server, there are some cases that the error mail will not be sent back.

4. Messages cannot be received in an HTML format. This format is not supported. All messages must be received in a TIFF-F Format.

5. If the size of a documents image data is huge, there is a possibility of unsuccessful transmission if the system administrator has imposed a limit on the maximum size of E-mails and their attachments. The document you are sending should be separated into smaller documents that will be accepted by the mail server. (Ex. A 42 page document of the CCITT#1 test chart is approximately 1Mbyte in size).

6. If you do not receive E-mail, check the Auto Polling setting and Polling frequency.

7. If you cannot retrieve mail from the mail server, check the settings for the POP3 server and Mailbox name. Check that the POP3 password is entered correctly. This setting is case sensitive.

8. If Relay Broadcast is not forwarding E-mail to a G3 Fax, check the Relay Broadcast settings and Relay Domain registration. A Relay Domain must be entered for this function to work.
9 The Relay Broadcasting and Broadcasting features cannot be used at the same time.

10 Relay Broadcast can support the relay of a document up to a maximum of 48 Fax machines through conventional telephone lines. If sending to more than 48 locations the sender must divide the transmission locations into 48 locations or less for each relay broadcast.

11 When receiving E-mail messages from the POP3 server, the machine can receive a maximum of 32 mail messages. If there are more than 32 mail messages in the POP3 server, the machine will receive a maximum of 32 mail massages and then receive the remaining after the next polling interval.

12 The Print/Fax Server requires a portion of the user memory for operation. With the Print/Fax Server (Network board) installed the number of Fax sheets that can be sent or received will be reduced from the standard machine capacity.
Appendix A

General Information

You can change the configuration of your Print/Fax server using any of the following methods.

- Imagistics BRAdmin Professional utility for Windows® 95/98/Me, Windows NT® 4.0 and Windows® 2000/XP
- HTTP (using a web browser)
- WebJetAdmin Software

BRAdmin Professional utility (Recommended)
The Imagistics BRAdmin Professional utility can use the TCP/IP or IPX/SPX protocol. This utility allows you to graphically manage aspects of the network and printer. It can also be used to upgrade the firmware of the Print/Fax server.

HTTP (Recommended)
Use your favorite web browser to connect to the Imagistics Print/Fax server. This will allow you to configure machine and/or Print/Fax server parameters.

WebJetAdmin
Imagistics's Print/Fax server range is HP WebJetAdmin compatible.
# Using Services

## General

A service is a resource that can be accessed by computers that wish to print to the Imagistics Print/Fax server. The Imagistics Print/Fax server provides the following predefined services (do a SHOW SERVICE command in the Imagistics Print/Fax server remote console to see a list of available services): Enter HELP at the command prompt for a list of supported commands.

<table>
<thead>
<tr>
<th>Service (Example)</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>BINARY_P1</td>
<td>TCP/IP binary, NetBIOS service.</td>
</tr>
<tr>
<td>TEXT_P1</td>
<td>TCP/IP text service (adds carriage return after each line feed).</td>
</tr>
<tr>
<td>POSTSCRIPT_P1</td>
<td>PostScript service (switches PJL-compatible printer to PostScript mode).</td>
</tr>
<tr>
<td>PCL_P1</td>
<td>PCL service (switches PJL-compatible printer to PCL mode).</td>
</tr>
<tr>
<td>BRN_xxxxxx_P1_AT</td>
<td>AppleTalk and LPD service for Mac OS 8.6 or later.</td>
</tr>
<tr>
<td>BRN_xxxxxx_P1</td>
<td>NetWare service and AppleTalk service with Quickdraw Driver for Mac OS 8.6 - 9.1, 10.1-10.2.1 or greater (TCP/IP is enabled for backwards compatibility).</td>
</tr>
</tbody>
</table>

Where xxxxxxx is the last six digits of the Ethernet address (for example, BRN_310107_P1).
Reloading the Print / FAX Server Firmware

**General**

The firmware on the Print/Fax server is stored in flash memory. This means that you can upgrade the firmware by downloading the appropriate update file.

The Print / Fax server supports multiple models so when inserted into the machine the version of the NC-9100h hardware is checked against the firmware of your machine. If the firmware for your Print/ Fax server has been superseded with a later version of firmware for your model a message is displayed on the LCD. “Please update your firmware”.

Some software versions that we provide will automatically factory reset your Print/Fax server parameters. We try to avoid doing this. However, if we add a significant new feature to our Print/Fax server, it can result in the Print/Fax server being factory reset.

Because of this, we STRONGLY recommend that you make a note of the current Print/Fax server configuration before you upgrade. To do this, print out a configuration page (Refer to “Resetting the Print/ Fax Server back to factory settings (Test Switch)” on page 14-4how to print a network configuration page).

There are three methods of upgrading the firmware in your Imagistics Print/Fax server:

1. Use the BRAdmin Professional utility *(Recommended)*

2. Use the FTP protocol *(Recommended if running on Macintosh or Unix network)*

3. Use another system (such as a Novell or Unix system to send the new firmware file to the Print/Fax server).
Reloading firmware using BRAdmin Professional utility

The BRAdmin Professional utility can be used to easily re-program your Imagistics Print/Fax server.

1 Start BRAdmin Professional utility.

2 Highlight the appropriate Print/Fax server. Then press select the Control menu and choose Load Firmware. You can select more than one Print/Fax server by pressing CTRL+<select> or SHIFT+<select> on each additional Print/Fax server.

There are three possible ways of sending the new software version to the print server. For whichever method you select, you must enter a password for the print server. The default password for the Print/Fax server is access.

3 TFTP PUT from this host

Use this method if you have TCP/IP already installed on your PC. BRAdmin Professional utility will use the TFTP protocol to send the new firmware data to the Print/Fax server.

4 TFTP GET from a server

If you have a TFTP server installed in your network (many Unix systems provide TFTP support), you may wish to use this option. The new firmware file must be located in the TFTP BOOT directory on your TFTP server. In this case, your PC makes the Print/Fax server read the firmware data from the assigned TFTP server. If you do not provide the correct file name, then the upgrade will fail. You must also ensure that the firmware file is set so that the Print/Fax server can read the file. On Unix systems you can use the chmod command to specify file attributes. For example, chmod filename 666 allows the filename to be accessed by anyone. Also make sure that the TFTP service is running on your Unix server.
5 Netware GET from a server

You must have a Netware server on your network (running IPX/SPX) and you must store the new firmware file in the SYS/Login directory of the server. In this case, your PC makes the Print/Fax server read the firmware data from the assigned Netware server, the Print/Fax server attaches to the Netware server and reads the firmware itself.

AFTER SENDING FIRMWARE TO THE MACHINE, DO NOT TURN OFF THE MACHINE UNTIL AFTER THE MACHINE HAS PERFORMED AN AUTOMATIC RESTART.
Reloading using the FTP Protocol from a command prompt

By specifying the Print/Fax server PASSWORD AS THE USERNAME when logging on, it becomes possible to upgrade the firmware of the Print/Fax server or printer (if supported). The following example assumes that the Print/Fax server password is “cambridge”

D:\>ftp
ftp> open 220.0.250.200
Connected to 220.0.250.200.
220 FTP print service:V-1.05/Use the network password for the ID if updating.
User (220.0.250.200:(none)): cambridge
230 User cambridge logged in.
ftp> bin
200 Ready command OK.
ftp> hash
Hash mark printing on ftp: (2048 bytes/hash mark).
ftp> send brnt261.blf
200 Ready command OK.
150 Transfer Start
#################################################
########
#################################################
#################################################
#################################################
###########################
226 Data Transfer OK/Entering FirmWareUpdate mode.
ftp: 1498053 bytes sent in 8.52Seconds
175.77Kbytes/sec.
ftp> close
226 Data Transfer OK.
ftp> quit

When you see “226 Data Transfer OK/Entering FirmWareUpdate mode”, you can be sure that the firmware file is being transferred to the Print/Fax server. If you do not see this message, the file you are sending to the printer will either be ignored or the printer will print garbage.

You must use the “bin” command to put the FTP client into Binary communications mode. If you do not specify the bin command the upgrade process will not function correctly.
Appendix D

Updating other machines through the Network

It is possible to program Imagistics machines on the network with either settings from an already programmed machine or with data from the Imagistics Network PC-FAX Address Book. (See User’s Guide on the CD-ROM.)

When Imagistics Network PC-FAX in used from a PC that has BRAdmin Professional installed, an extra option appears in BRAdmin. By selecting a networked machine in the BRAdmin main window and right clicking it you will be presented with an extra option, Import Auto Dial.

When you select this option BRAdmin reads the telephone settings from that machine (if there are any programmed) into PC-FAX Address Book.
Illustrated below is the Address Book, on the left are One-Touch / Speed-Dial numbers read from the machine. On the right is the Address Book. It is now possible to allocate One-Touch / Speed-Dial numbers from the machine into the Address Book and also use members of the Address Book and send them to the machine. You can now make changes to the data in the Network PC-FAX Address Book and click OK.

This data is then stored in the Windows® Temp Folder and can be used to update singular or multiple machines on the network.

Highlight singular or multiple networked Imagistics machines in the main BRAdmin window by highlighting and pressing the shift key on your keyboard. Right click the highlighted machine and press Send Auto Dial. The new data is then sent to all the highlighted machine.
A dialog box is displayed showing the upload status of current machine and beneath this the whole progress is displayed if updating multiple machines.

When the process is finished a dialog box is displayed showing which machine on the network have been updated.
Appendix E

Specifications

Operating System Support

Windows® 95/98/98SE/Me/NT® 4.0 and Windows® 2000/XP

Unix systems supporting LPD

Mac OS8.6-9.1 / OS 10.1 - 10.2.1 or greater

Protocol Support

TCP/IP(including the following)

- RARP, BOOTP, DHCP, APIPA , NetBIOS, WINS, DNS Resolver, LPR/LPD, Port9100, SMTP/ POP3, SMB(NetBIOS/IP), IPP, FTP, SSDP , Rendezvous , TELNET, HTTP, SNMP, TFTP

IPX/SPX

AppleTalk (EtherTalk)

DLC/LLC

Network

10/100Base-TX Ethernet Network

Network Printing

Windows® 95/98/Me Peer-to-Peer Printing

Windows® NT® 4.0 / Windows® 2000/XP TCP/IP Printing

Unix TCP/IP Printing

Novell NetWare Printing
Macintosh Printing (PostScript or Quick Draw over AppleTalk)

Rendezvous

**Network PC Fax send**

Windows® 95/98/98SE/Me/NT® 4.0 and Windows® 2000/XP

Mac OS8.6-9.1 / OS 10.1 - 10.2.1 or greater

**Network Scanning**

B/W Resolution (TIFF-F): 200x100, 200x200dpi

Color Resolution (JPEG/PDF): 150x150, 300x300, 600x600dpi

[Check] Windows® 98/98SE/Me and Windows® 2000/XP

[Check] Up to 25 clients can be connected to one machine at a time.

**Internet Fax**

T.37 Simple mode

Tiff-F Profile-S

Resolution: 200x100, 200x200, 204x98, 204x196dpi

Coding System: MH

Width: 1728 dot

Fax / E-mail / I-Fax Forwarding / Paging feature.

(Please check the User Guide for your Imagistics machine to verify if this feature is available).

Scan to key: E-mail / OCR / Image / File

Internet Fax Relay

E-mail Relay
Relay Broadcast

SMTP/POP3 Email server required.

**Computer Requirements (for drivers, BRAdmin Professional, Peer-to-Peer software, etc.)**

**CPU**

- Pentium 75MHz or Higher for Windows® 95/98/98SE/NT® 4.0
- Pentium 150MHz or Higher for Windows® Me
- Pentium 133MHz or Higher for Windows® 2000
- Pentium 233MHz or Higher for Windows® XP

**RAM**

- 24MB or greater (32MB recommended) for Windows® 95/98/98SE
- 32MB or greater (64MB recommended) for Windows® Me/NT® 4.0
- 64MB or greater (128MB recommended) for Windows® 2000/XP

**For AppleTalk connection**

**Computer**

- Ethernet ready Power Macintosh

**RAM**

- 32MB or more (64MB or more recommended) for Mac OS 8.6-9.2
- 128MB or more (160MB or more recommended) for OS X 10.1 - 10.2.1 or greater

**OS**

- Mac OS 8.6-9.1 / OS 10.1 - 10.2.1 or greater
- Open Transport 1.3 or later
Management Utilities

Web Based Management

- Internet Explorer 5.xx or later
- Netscape Navigator 4.xx or later

BRAdmin Professional utility

- Windows® 95/98/98SE/Me/NT® 4.0 and Windows® 2000/XP
